

Smart High-Side Power Switch Four Channels: $4 \times 35 \text{m}\Omega$

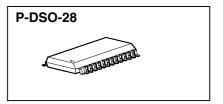

Advanced Current Sense

Product Summary

Operating Voltage	$V_{bb(on)}$	4.5 .	40V
	Active channels	one	four parallel
On-state Resistance	R _{on}	$35 m\Omega$	$9m\Omega$
Nominal load current	I _{L(NOM)}	5.4A	11.1A
Current limitation	I _{L(SCr)}	21A	21A

with ReverSave™

Package

General Description

- N channel vertical power MOSFET with charge pump, ground referenced CMOS compatible input and diagnostic feedback, monolithically integrated in Smart SIPMOS® technology.
- Fully protected by embedded protection functions

Applications

- μC compatible high-side power switch with diagnostic feedback for 12V and 24V grounded loads
- All types of resistive and capacitve loads
- Most suitable for loads with high inrush currents, so as lamps
- Replaces electromechanical relays, fuses and discrete circuits

Basic Functions

- Very low standby current
- Improved electromagnetic compatibility (EMC)
- CMOS compatible input
- Stable behaviour at undervoltage
- Wide operating voltage range

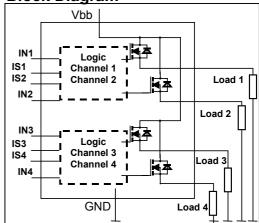

Protection Functions

- Reverse battery protection without external components (ReverSave™)
- Short circuit protection
- Overload protection
- **Current limitation**
- Thermal shutdown
- Overvoltage protection (not load dump) without external
- Loss of ground protection
- Electrostatic discharge protection (ESD)

Diagnostic Function

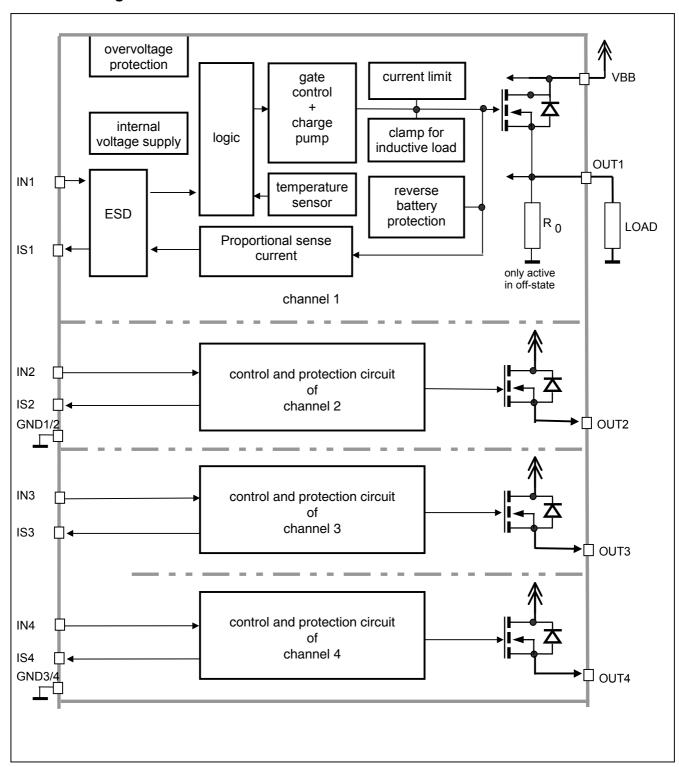

Proportional load current sense (with defined fault signal during thermal shutdown)

Thermal hysteresis

Κ

10

⁸⁾ Supply voltages higher than $V_{bb(AZ)}$ require an external current limit for the GND and status pins (a 150 Ω resistor for the GND connection is recommended). See also $V_{ON(CL)}$ in table of protection functions and circuit diagram on page 10.

⁹⁾ Measured with load; for the whole device; all channels off

¹⁰⁾ Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

 $^{^{11)}}$ If channels are connected in parallel, output clamp is usually accomplished by the channel with the lowest $^{
m V}_{
m ON(CL)}$

Parameter and Conditions, each of the four channels	Symbol	Values			Unit
at T _j = -40+150°C, V_{bb} = 12 V unless otherwise specified		min	typ	Max	
Reverse Battery					
Reverse battery voltage 12)	-V _{bb}			28	V
On-state resistance with reverse battery $I_L = 2A$; $V_{bb} = 12V$ $T_j = 25$ °C: $T_j = 150$ °C:	R _{on}		45 80	60 120	mΩ
Input ¹³⁾					
Input resistance (see circuit page 10)	R_{I}	2.5	3.5	6.0	kΩ
Input turn-on threshold voltage	$V_{IN(T+)}$	1.7		3.2	V
Input turn-off threshold voltage	$V_{\text{IN(T-)}}$	1.5			V
Input threshold hysteresis	$\Delta V_{\text{IN(T)}}$		0.3		V
Off state input current $V_{IN} = 0.4 \text{ V}$:	I _{IN(off)}	1		35	μΑ
On state input current $V_{IN} = 5 \text{ V}$:	I _{IN(on)}	20	50	90	μΑ

Power dissipation is higher compared to normal operating conditions due to the elevated on-state reistance. The temperature protection and sense functionality is not active during reverse current operation! Input and Status currents have to be limited (see max. ratings page 4 and circuit page 10).

 $^{^{\}rm 13)}$ If ground resistors $\rm R_{\rm GND}$ are used, add the voltage drop across these resistors.

Current sense leakage/offset current					
$V_{IN}=0, \ V_{IS}=0, \ I_{L}=0$: $V_{IN}=5 \ V, \ V_{IS}=0, \ I_{L}=0$:	I _{IS(LL)}		 2.5	1 	μΑ
Current sense settling time to $I_{\text{IS static}} \pm 10\%$ after positive input slope, $I_{\text{L}} = 0$ 5 A, (not tested, specified by design)	t _{son(IS)}			300	μs
Internal output pull down only active in off-state	R ₀		7		kΩ

¹⁴⁾ In the case of current limitation or thermal shutdown the sense signal is no longer a current proportional to the load current, but a fixed voltage of typ. 5 V.

In the case of thermal shutdown the V_{fault} signal remains for $t_{delay(fault)}$ longer than the restart of the switch (see diagram on page 15).

Truth Table

	Input level	Output level	Current Sense IIS
Normal	L	L	0
Operation	Н	Н	nominal
Current- Limitation ¹⁶⁾	Н	Н	\mathbf{V}_{fault}
Short circuit to GND	L H	ΙЦ	0 V _{fault}
Overtemperature	L H	اـ اـ	0 V _{fault}
Short circuit to Vbb	L H	ΗH	0 <nominal 17)<="" td=""></nominal>
Open load	L H	Z H	0
Negative output Voltage clamp	L	L	0

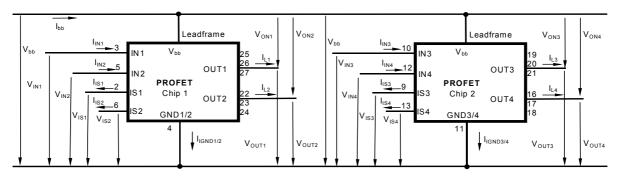

L = "Low" Level X = don't care

Z = high impedance, potential depends on external circuit

H = "High" Level $V_{tault} = 5V$ typ, constant voltage independent of external used sense resistor.

Parallel switching of channels is possible by connecting the inputs and outputs in parallel. The current sense outputs have to be connected with a single sense resistor.

Terms

Leadframe (V_{bb}) is connected to pin 1, 7, 8, 14, 15, 28

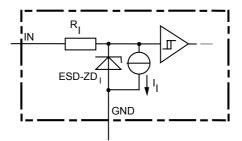

.

¹⁶⁾ Current limitation is only possible while the device is switched on.

Low ohmic short to $V_{
m bb}$ may reduce the output current $I_{
m L}$ and therefore also the sense current $I_{
m IS}$.

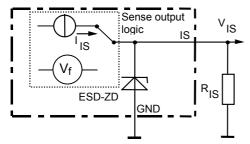

Input circuit (ESD protection), IN1 to IN4

The use of ESD zener diodes as voltage clamp at DC conditions is not recommended.

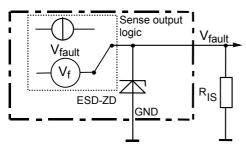

Sense output

Normal operation: IS = IL / kILIS $V_{IS} = I_S * R_{IS}$; $R_{IS} = 1 k\Omega$ nominal $R_{IS} > 500\Omega$

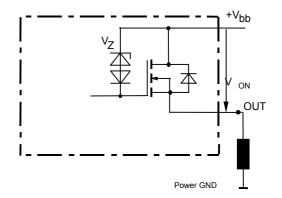

ESD-Zener diode: V_{ESD} = 6.1 V typ., max 14 mA;

Operation under fault condition so as thermal shut down or current limitation

 $V_{fault} = 6V typ$ Vfault < VESD under all conditions

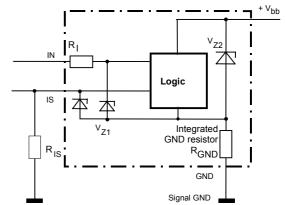

Overvoltage output clamp, OUT1 or OUT2

VON clamped to VON(CL) = 21 V typ.

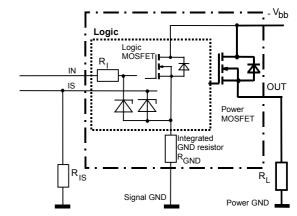

Overvoltage protection of logic part

 $V_{Z1} = 6.1 \text{ V typ.}, V_{Z2} = 47 \text{ V typ.}, R_{I} = 3.5 \text{ k}\Omega \text{ typ.},$ $R_{GND} = 75 \Omega$

Reverse battery protection

 $R_{\text{GND}} = 75 \ \Omega, R_{\text{I}} = 3.5 \ \text{k}\Omega \text{ typ},$

In case of reverse battery the channel of the MOSFET is turned on.

Temperature protection and sense functionality is not active during inverse current operation.

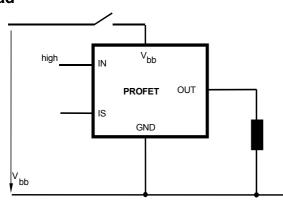

GND disconnect

Any kind of load. In case of IN=high is $V_{OUT} \approx V_{IN} - V_{IN}(T_+)$. Due to $V_{GND} > 0$, no $V_{ST} = low$ signal available.

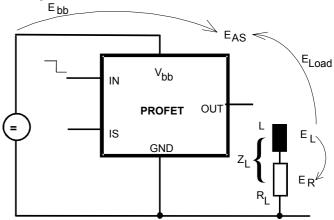

V_{bb} disconnect with energized inductive load

For inductive load currents up to the limits defined by $Z_{\rm L}$ (max. ratings and diagram on page 11) each switch is protected against loss of V_{bb} .

Consider at your PCB layout that in the case of Vbb disconnection with energized inductive load all the load current flows through the GND connection.

Inductive load switch-off energy dissipation

Energy stored in load inductance:

$$E_L = \frac{1}{2} \cdot L \cdot I_1^2$$

While demagnetizing load inductance, the energy dissipated in PROFET is

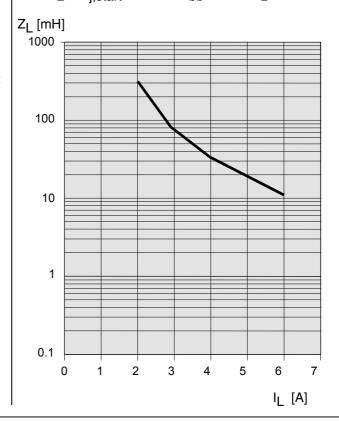

$$E_{AS} = E_{bb} + E_L - E_R = V_{ON(CL)} \cdot i_L(t) dt,$$

with an approximate solution for $R_L > 0 \Omega$:

$$E_{\text{AS}} = \frac{I_{\text{L}} \cdot L}{2 \cdot R_{\text{L}}} \left(V_{\text{bb}} + |V_{\text{OUT(CL)}}| \right) \ ln \left(1 + \frac{I_{\text{L}} \cdot R_{\text{L}}}{|V_{\text{OUT(CL)}}|} \right)$$

Maximum allowable load inductance for a single switch off (one channel)⁴⁾

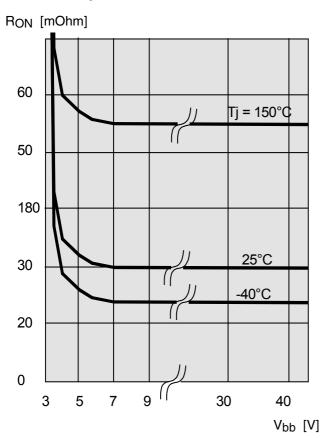

$$L = f(I_L)$$
; T_{j,start} = 150°C, V_{bb} = 12 V, R_L = 0 Ω

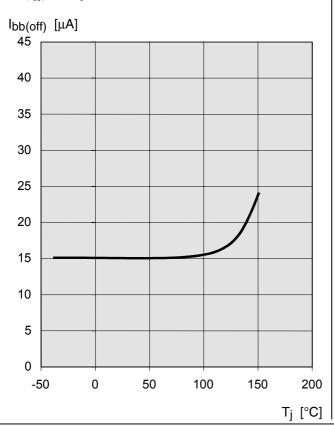

Typ. on-state resistance

 $R_{ON} = f(V_{bb}, T_j); I_L = 2 A, IN = high$

Typ. standby current

 $I_{bb(off)} = f(T_j); V_{bb} = 9...34 \text{ V}, IN1,2,3,4 = low$

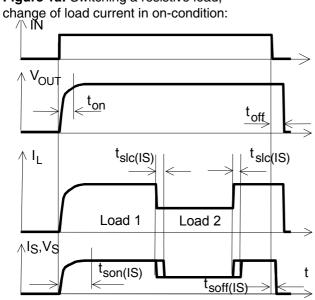

Functionality diagrams

All diagrams are shown for chip 1 (channel 1/2). For chip 2 (channel 3/4) the diagrams are valid too. The channels 1 and 2, respectively 3 and 4, are symmetric and consequently the diagrams are valid for each channel as well as for permuted channels

Figure 1a: Switching a resistive load,

The sense signal is not valid during settling time after turn on or change of load current.

Figure 1b: V_{bb} turn on: \uparrow IN

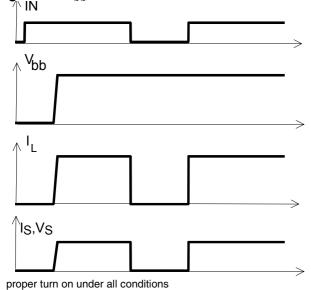

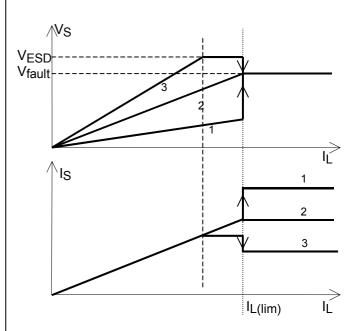

Figure 1c: Behaviour of sense output: Sense current (Is) and sense voltage (Vs) as

function of load current dependent on the sense resistor

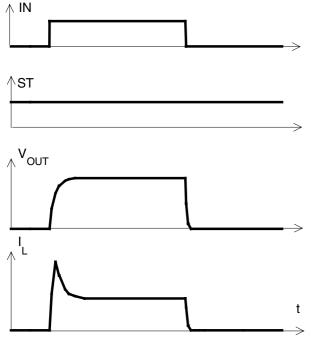

Shown is V_S and I_S for three different sense resistors. Curve 1 refers to a low resistor, curve 2 to a medium-sized resistor and curve 3 to a big resistor. Note, that the sense resistor may not fall short of a minimum value of 500Ω .

IS = IL / kILIS $V_{IS} = I_S * R_{IS}$; $R_{IS} = 1 k\Omega$ nominal $R_{IS} > 500\Omega$

Figure 2a: Switching a lamp:

The initial peak current should be limited by the lamp and not by the current limit of the device.

Figure 2b: Switching a lamp with current limit: The behaviour of IS and VS is shown for a resistor, which refers to curve 1 in figure 1c

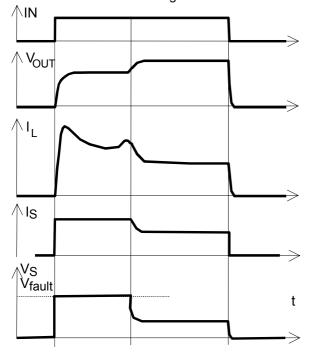

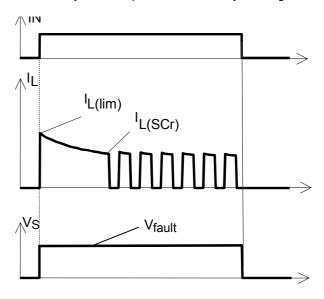

Figure 3a: Short circuit:

shut down by overtempertature, reset by cooling

Heating up may require several milliseconds, depending on external conditions

 $I_{LL(lim')} = 50$ A typ. increases with decreasing temperature.

Figure 3b: Turn on into short circuit: shut down by overtemperature, restart by cooling (two parallel switched channels 1 and 2)

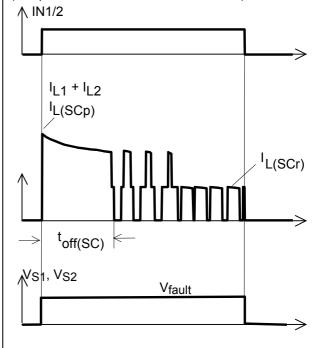

Figure 4a: Overtemperature:

Reset if $T_i < T_{it}$

The behaviour of IS and VS is shown for a resistor, which refers to curve 1 in figure 1c

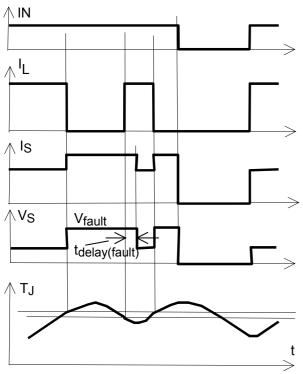

Figure 6a: Current sense versus load current:

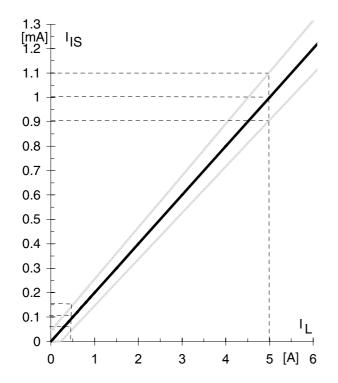

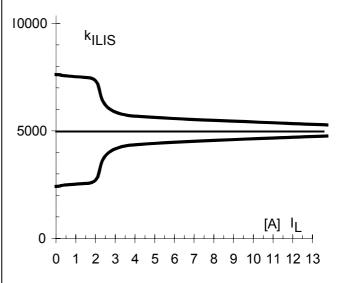

Figure 6b: Current sense ratio 18):

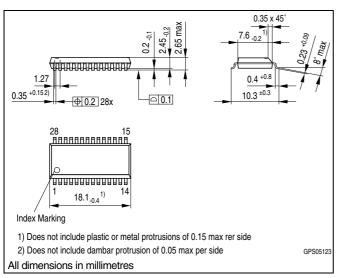

¹⁸⁾ This range for the current sense ratio refers to all devices. The accuracy of the $k_{\rm LLS}$ can be raised at least by a factor of two by calibrating the value of $k_{\rm LLS}$ for every single device.
