

Power Supply IC Series for TFT-LCD Panels

Output voltage fixed-type Multi-channel System Power Supply IC

BD8174MUV
General Description

The BD8174MUV is a system power supply IC that generates 6 power supply channels required by TFT-LCD panels on a single chip. Output voltage and sequence is fixed so that it is possible to control output with few external components.

Key Specifications

- Power Supply Voltage 1 Range: 10V to 14V
- Oscillating Frequency: 700kHz(Typ)
- Operating Temperature Range: -40°C to +105°C

Features

- Step-up DC/DC Converter with Built-in 3A FET
- Synchronous Step-down DC/DC Converter with Built-in 2A FET
- High Voltage LDO (50mA)
- Low Voltage LDO (400mA)
- Positive/ Negative Charge Pumps (Integrated-diode)
- 10bit DAC 4CH
- VCOM Amplifier
- Gate Shading Function
- All-output Shut Down Function
- Power Good Function
- Protection Circuits:
 - Under-Voltage Lockout Protection Circuit
 - Thermal Shutdown Circuit
 - Over Current Protection Circuit
 - Over Voltage Protection Circuit
 - Timer Latch Type Short-Circuit Protection Circuit
- Constant Startup Sequence

Package

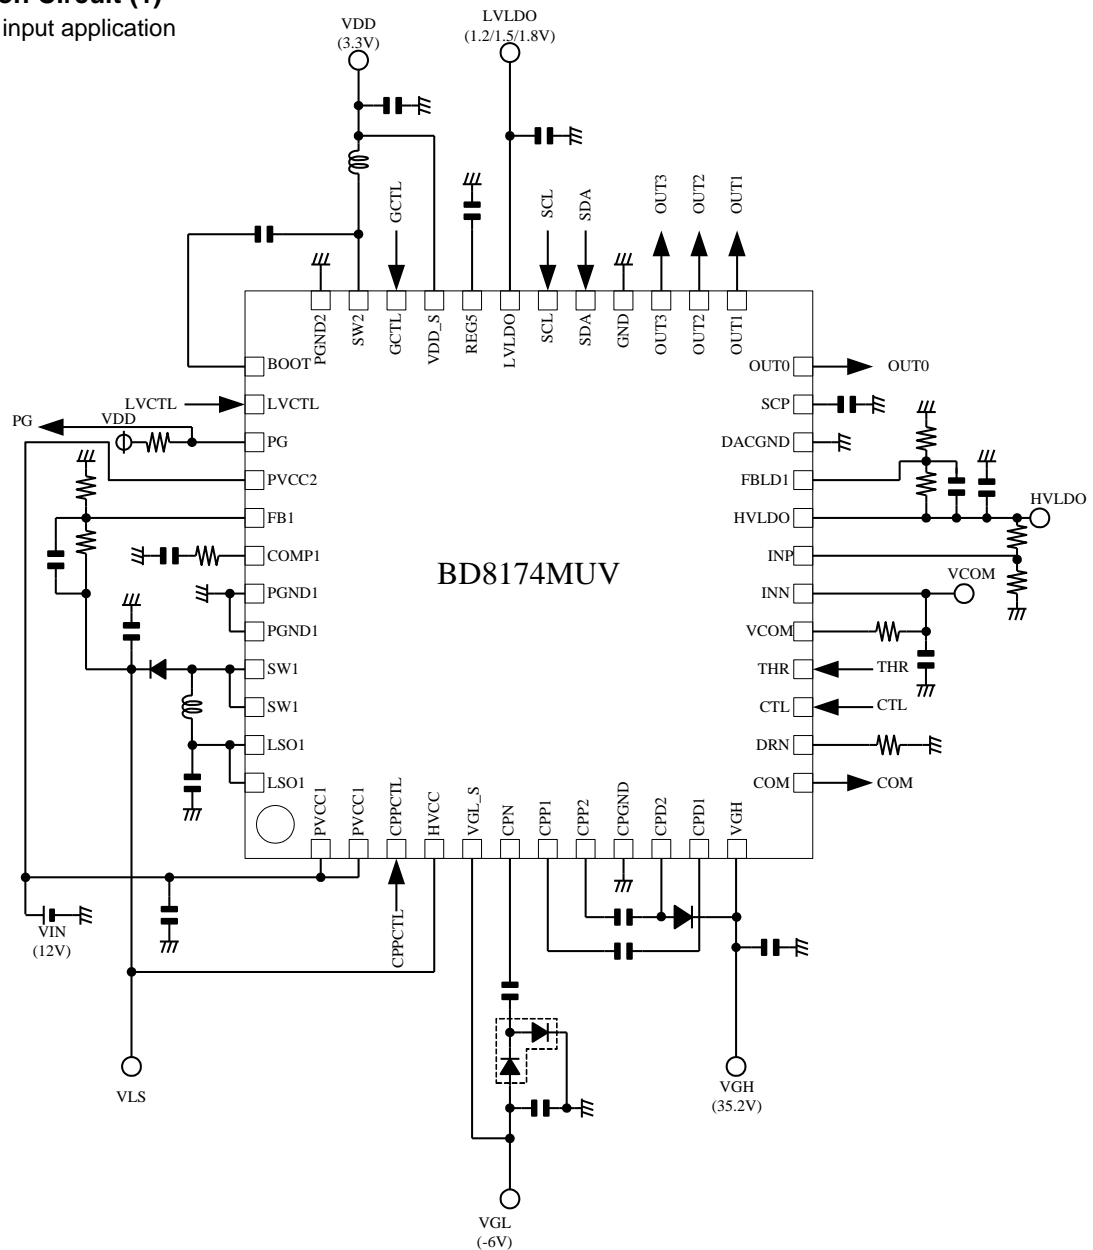

W(Typ) x D(Typ) x H(Max)

Applications

LCD TV power supplies

Typical Application Circuit (1)

1. VCC12V input application

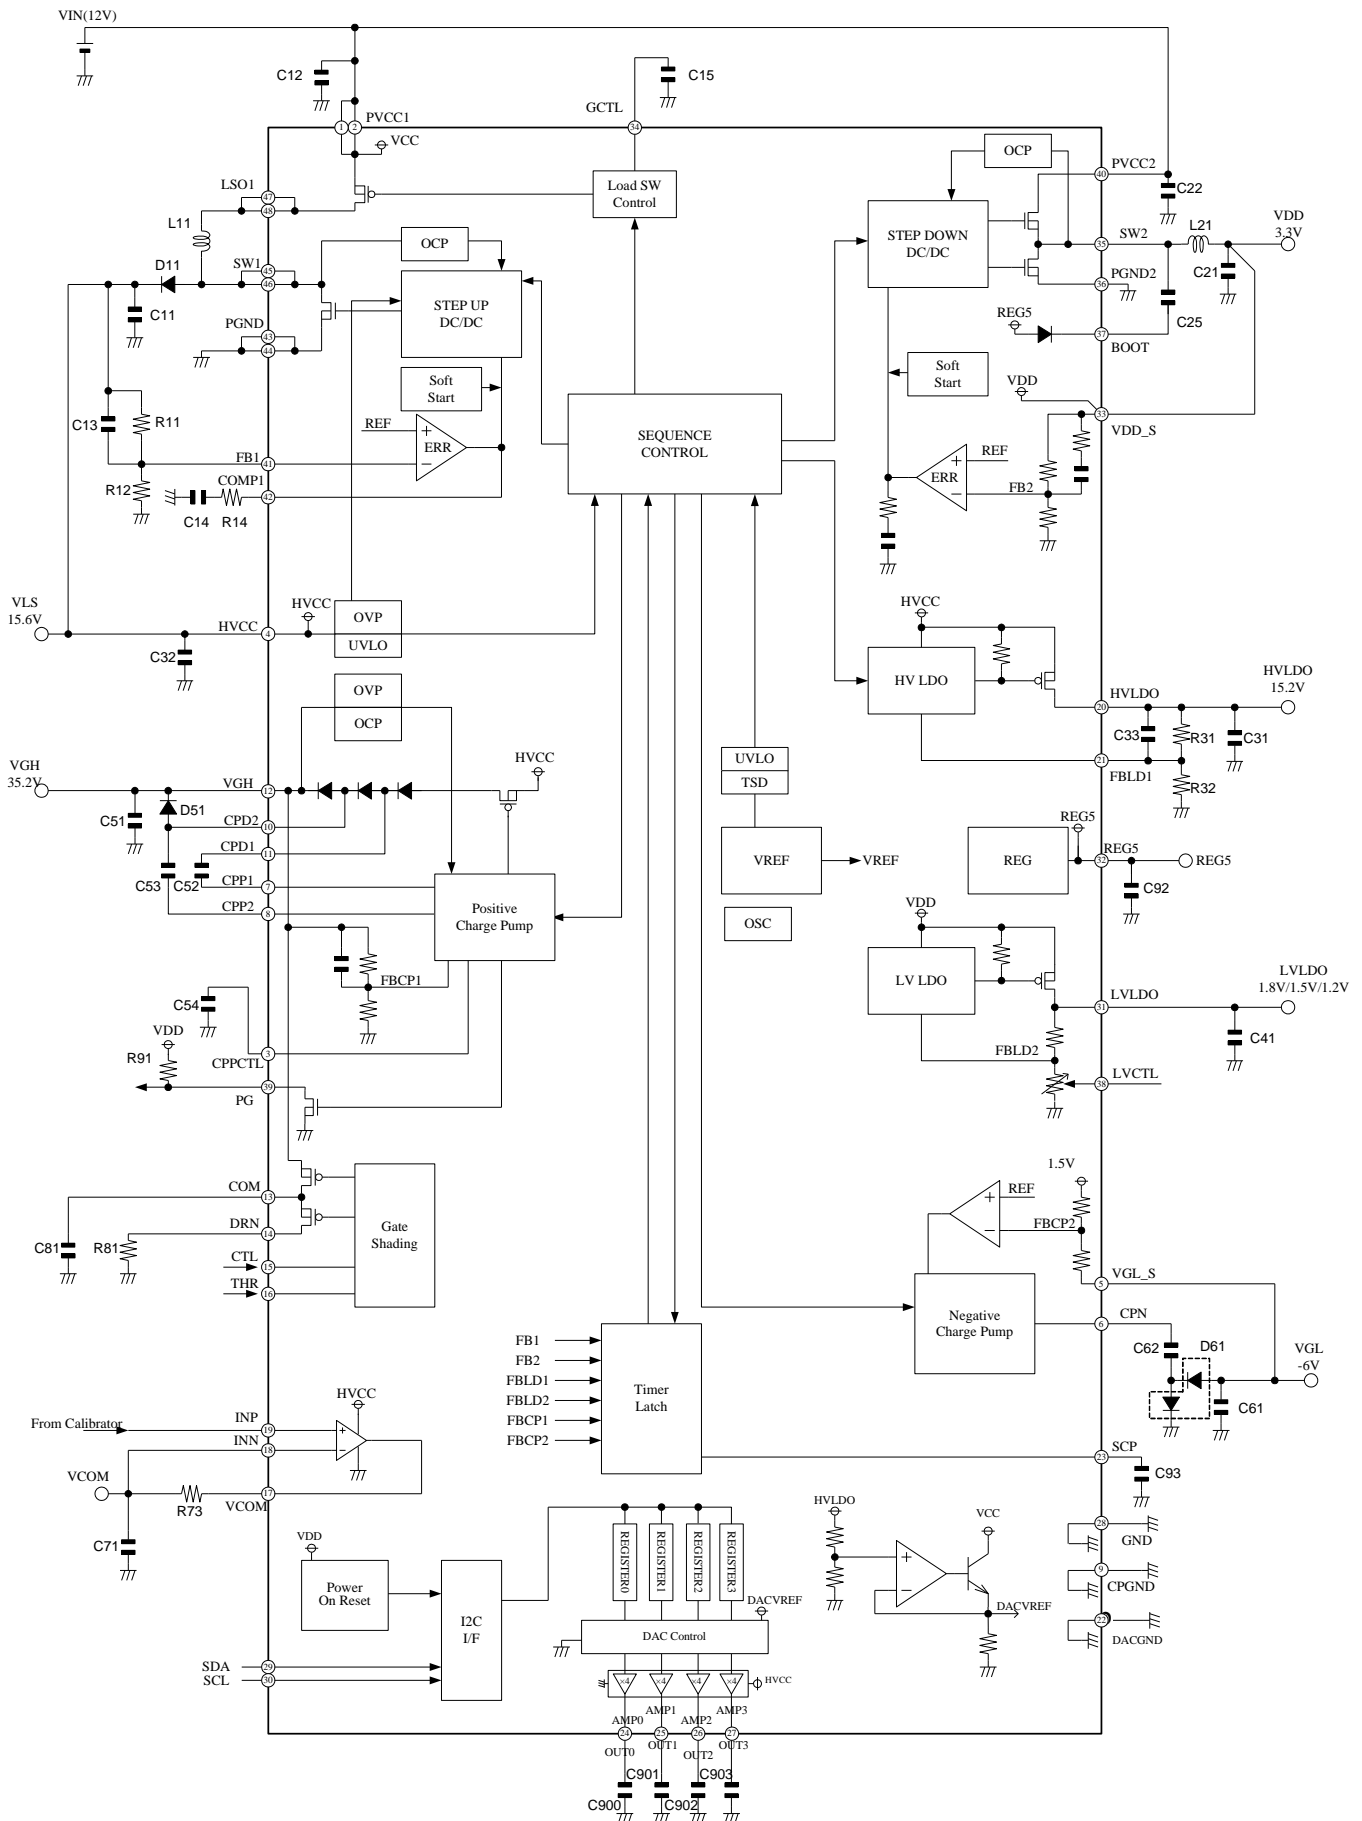

2. Startup sequence

3. Power up sequence

Block Diagram

Application Parts List (When VLS=15.6V, HVLDO=15.2V is configured)

Pin Configuration

Pin Description

PIN NO.	Pin name	Function
1	PVCC1	Boost DC/DC load switch input. See Boost DC/DC (1) for more information.
2	PVCC1	Boost DC/DC load switch input. See Boost DC/DC (1) for more information.
3	CPPCTL	Positive charge pump control input. See charge pump (4) for more information.
4	HVCC	Power supply pin for charge pump, buffer amplifier and HV_LDO.
5	VGL_S	Negative charge pump output VGL feedback input.
6	CPN	Negative charge pump regulator driver output. Drive pin for negative charge pump. See charge pump (4) for more information.
7	CPP1	Positive charge pump regulator driver output1. Drive pin for positive charge pump. See charge pump (4) for more information.
8	CPP2	Positive charge pump regulator driver output2. Drive pin for positive charge pump. See charge pump (4) for more information.
9	CPGND	Power grounding pin at charge pump.
10	CPD2	Positive charge pump internal switching diode output2.
11	CPD1	Positive charge pump internal switching diode output1.
12	VGH	Positive charge pump output VGH. Connect output capacitor from this pin to GND.
13	COM	Gate shading output pin.
14	DRN	Termination of the low side switch of the gate voltage shading block.
15	CTL	Gate shading control input pin.
16	THR	Gate shading Low level setting pin.
17	VCOM	VCOM Output
18	INN	VCOM input-.
19	INP	VCOM input+.
20	HVLDO	HV_LDO output pin. Insert output capacitance for GND.
21	FBLD1	HV_LDO feedback input pin.
22	DACGND	GND pin for DAC.
23	SCP	Short protection delay pin. To set short protection delay time, connect capacitor for GND pair. For details, refer to information in common block (6).
24	OUT0	Gamma output pin.
25	OUT1	Gamma output pin.
26	OUT2	Gamma output pin.
27	OUT3	Gamma output pin.
28	GND	Grounding pin.
29	SDA	Serial data input pin.
30	SCL	Serial clock input pin.
31	LVLDO	LV_LDO output pin. Output outputs 1.8V/ 1.5V/ 1.2V (typ). Insert output capacitance for GND.
32	REG5	Internal power supply 5.0V output pin. Connect 0.1μF from this pin to ground.
33	VDD_S	Buck DC/DC output VDD feedback input. No external resistance necessary for feedback register.
34	GCTL	Boost DC/DC load switch PGATE control input. For details, refer to information in Boost DC/DC (1).
35	SW2	Buck DC/DC switching output. Due to reduce EMI, make a wiring thick and short.
36	PGND2	Buck DC/DC switching node power grounding pin. Due to reduce EMI, make a wiring thick and short.
37	BOOT	Buck DC/DC bootstrap pin. This pin generates the gate drive voltage for the Buck converter. Connect 0.1μF from this pin to the switch pin of step down converter, SW2.
38	LVCTL	LVLDO output voltage setting pin.
39	PG	Power good output. After positive charge pump output VGH startup, It will be ON. For Buck DC/DC output, Pull-UP and use it. If you don't use it, It will open.
40	PVCC2	Buck DC/DC high side MOSFET power supply input. Connect a capacitor as close to PVCC pin as possible.

Pin Description – Continued

PIN NO.	Pin name	Function
41	FB1	Boost DC/DC output VLS feedback input. Connect a external resister and insert resistance for phase compensation setting between VLS. For details, refer to information in Boost DC/DC (1).
42	COMP1	Boost DC/DC error amplifier output pin. Connect a resistance for phase compensation and capacitor. For details, refer to information in Boost DC/DC (1).
43	PGND1	Boost DC/DC switching node power ground pin. Due to reduce EMI, make a wiring thick and short.
44	PGND1	Boost DC/DC switching node power ground pin. Due to reduce EMI, make a wiring thick and short.
45	SW1	Boost DC/DC switching output. Due to reduce EMI, make a wiring thick and short.
46	SW1	Boost DC/DC switching output. Due to reduce EMI, make a wiring thick and short.
47	LSO1	Boost DC/DC load switch output. For details, refer to information in Boost DC/DC (1).
48	LSO1	Boost DC/DC load switch output. For details, refer to information in Boost DC/DC (1).

Absolute Maximum Ratings (Ta=25°C)

Parameter	Symbol	Rating	Unit
Power Supply Voltage 1	V _{PVCC1} , V _{PVCC2}	15	V
Power Supply Voltage 2	V _{HVCC}	20	V
SW1 Pin Voltage	V _{SW1}	20	V
VGH Pin Voltage	V _{VGH}	40	V
Maximum Junction Temperature	T _{jmax}	150	°C
Power Dissipation	P _d	4.83 (Note 1)	W
Operating Temperature Range	T _{opr}	-40 to 105	°C
Storage Temperature Range	T _{stg}	-55 to 150	°C

(Note 1) To use the IC at temperatures over Ta=25°C, derate power rating by 38.61mW/°C.

When mounted on a four-layer glass epoxy board measuring 74.2mm x 74.2mm x 1.6mm (with all layer of copper foil 5505mm²).

Caution: Operating the IC over the absolute maximum ratings may damage the IC. The damage can either be a short circuit between pins or an open circuit between pins and the internal circuitry. Therefore, it is important to consider circuit protection measures, such as adding a fuse, in case the IC is operated over the absolute maximum ratings.

Recommended Operating Conditions (Ta=-40°C to +105°C)

Parameter	Symbol	Min	Max	Unit
Power Supply Voltage 1	V _{PVCC1} , V _{PVCC2}	10	14	V
Power Supply Voltage 2	V _{HVCC}	10	18	V
SW1 Pin Voltage	V _{SW1}	-	18	V
SW1 Pin Current	I _{SW1}	-	3 (Note 2)	A
SW2 Pin Current	I _{SW2}	-	2 (Note 2)	A
Power Good Pull-up Voltage	V _{PG}	-	5.5	V
CTL Pin Voltage	V _{GCTL} , V _{CPPCTL} , V _{CTL}	-	5.5	V
THR Pin Voltage	V _{THR}	1.0	2.5	V
LVCTL Pin Voltage	V _{LVCTL}	-	14	V
INP, INN Pin Voltage	V _{INP} , V _{INN}	-	14	V

(Note 2) Not to exceed P_d.

Description of Operation of Each Block and Procedure for Selecting Application Components

(1) Step-up DC/DC Converter Block

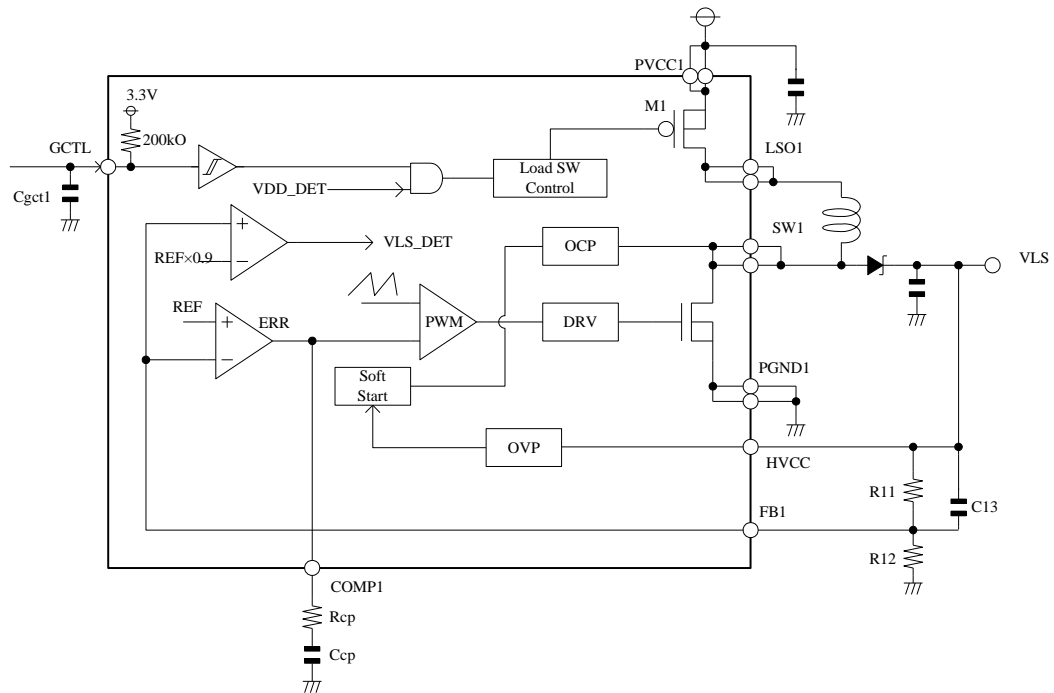

Figure 28. Step-up DC/DC Converter Block

Step-up DC/DC block is able to set output voltage by an external feedback resistor R11, R12.

Output voltage VLS is calculated by equation below.

$$VLS = 1.0 \times \frac{R11 + R12}{R12}$$

Also, OVP function is incorporated for protecting output voltage overshoot, so that if VLS voltage overshoots over 19V(Typ), prevents over voltage output by stopping switching.

(1.1) Startup sequence

After step-down DC/DC converter startup, Start-up sequence is fixed to start up.

When Step-down DC/DC(3.3V output) reaches 90% of the set voltage, step-up DC/DC will start operation.

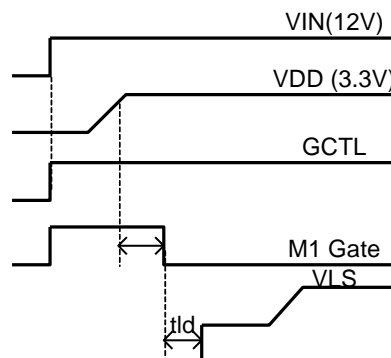

Soft start function is incorporated (About 1.5ms typ) in order to prevent overshooting during startup.

Also, controlling the startup timing of load switch (M1) by GCTL pin enables to control the VLS rising sequence.

For the startup timing of load switch (M1), there are two patterns: Use or Not use the GCTL pin.

① Case of Not using GCTL pin (Connect GCTL pin to OPEN or 3.3V.)

When disuse GCTL pin, if step-down DC/DC output (VDD) reach 90% of the configured voltage, load switch (M1) turns ON.

▪ Setting of load switch (M1) ON delay time (tld)

② Case of using GCTL pin

Using GCTL pin makes it possible to have ON timing of load switch (M1) can be delayed more than not using GCTL pin.

There are two methods for setting delay time by GCTL pin: Set the timing by inputting H/L logic signal to GCTL pin, or Set by constant time by inserting capacitor to GCTL pin.

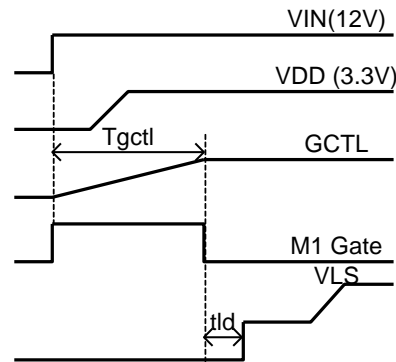

When setting the PGATE ON timing by constant time, ON delay time Tgctl is determined by the equation below.

$$T_{gctl} = -C_{gctl} \cdot R_{gctl} \cdot \ln \frac{V_{REF} - V_{th}}{V_{REF}}$$

$$= -C_{gctl} \cdot 200k \cdot \ln \frac{3.3 - 1.6}{3.3}$$

■ About GCTL delay time fluctuation

The rgdt1 has variation in current and voltage of $\pm 50\%$ that includes absolute variations and temperature characteristic, design systems with sufficient margin.

(1.2) Selecting the output L constant

The inductance L to be used for output is determined by the rated current I_{LR} and the maximum input current value I_{INMAX} of the inductor.

Figure 29. Coil Current Waveform (Step-up DC/DC Converter)

Make adjustments so that $I_{INMAX} + \Delta I_L / 2$ will not reach the rated current I_{LR} . At this time, ΔI_L is obtained by the following equation.

$$\Delta I_L = \frac{1}{L} V_{CC} \times \frac{V_o - V_{CC}}{V_o} \times \frac{1}{f} \quad [A]$$

wherein f : Switching frequency

In addition, since the coil L value may have variations in the range of approximately $\pm 30\%$, set this value with sufficient margin. If the coil current exceeds the rated current I_{LR} , the internal IC element may be damaged because of Large – current.

(1.3) Output capacitor setting

For capacitor C_o to be used for output, set it to the permissible value of the ripple voltage V_{PP} or that of the drop voltage at the time of a sudden load change, whichever is large.

The output ripple voltage is obtained by the following equation.

$$\Delta V_{PP} = I_{LMAX} \times R_{ESR} + \frac{1}{fC_o} \times \frac{V_{CC}}{V_o} \times (I_{LMAX} - \frac{\Delta I_L}{2})$$

Make this setting so that the voltage will fall within the permissible ripple voltage range.

For the drop voltage V_{DR} during a sudden load change, estimate the V_{DR} with the following equation.

$$V_{DR} = \frac{\Delta I}{C_o} \times 10\mu\text{sec} \quad [\text{V}]$$

Wherein, 10 μsec is the estimate of DC/DC response speed. Set C_o so that these two values will fall within the limit values.

Since the DC/DC converter causes a peak current to flow between input and output, capacitors must also be mounted on the input side. For this reason, it is recommended to use low-ESR capacitors above 10 μF and below 100m Ω as the input capacitors. Using input capacitors outside of this range may superimpose excess ripple voltage upon the input voltage, causing the IC to malfunction.

However, since the aforementioned conditions vary with load current, input voltage, output voltage, inductor value, and switching frequency, be sure to verify the margin using the actual product.

(1.4) Output rectifier diode setting

For the rectifier diodes to be used as the output stage of the DC/DC converter, it is recommended to use Schottky diodes. Select diodes with careful attention paid to the maximum inductance current, maximum output voltage, and power supply voltage.

$$\text{Maximum inductance current: } I_{LMAX} + \frac{\Delta I_L}{2} < \text{Rated current of diode}$$

$$\text{Maximum output voltage: } V_{OMAX} < \text{Rated voltage of diode}$$

In addition, since each parameter has variation in current and voltage of 30% to 40%, design systems with sufficient margin.

(1.5) Phase compensation setting

Phase setting procedure

The following conditions are required to ensure the stability of the negative feedback system.

- When the gain is set to "1" (0 dB), the phase lag should not be more than 150° (i.e., phase margin should not be less than 30°).

In addition, since DC/DC converter applications are sampled according to the switching frequency, the overall system GBW should be set to not more than 1/10 of the switching frequency. The targeted characteristics of the applications can be summarized as follows.

- When the gain is set to "1" (0 dB), the phase lag should not be more than 150° (i.e., phase margin should not be less than 30°).
- The GBW at that time (i.e., frequency when the gain is set to "0 dB") should not be more than 1/10 of the switching frequency.

The responsiveness is determined by the GBW limitation. Consequently, to raise the responsiveness, higher switching frequencies are required.

To ensure the stability through the phase compensation, it is necessary to cancel the secondary phase delay (-180°) caused by LC resonance with the secondary phase lead (in other words, by adding two phase leads).

The GBW (i.e., frequency when the gain is set to "0 dB") is determined by phase compensation capacitance connected to the error amplifier. If GBW needs to be reduced, increase the capacitance of the capacitor.

Open loop characteristics of integrator

(i) Ordinary integrator(Low-pass filter)

Figure 30

$$\text{Point(a)} \quad f_a = \frac{1}{2\pi R C A} \quad [\text{Hz}]$$

(ii) Open loop characteristics of integrator

Figure 31

$$\text{Point(b)} \quad f_b = \text{GBW} = \frac{1}{2\pi R C} \quad [\text{Hz}]$$

Since the phase compensation like that shown in (a) and (b) applies to the error amplifier, it will act as a low-pass filter.

For DC/DC converter applications, R represents feedback resistors connected in parallel.

According to the LC resonance of the output, two phase leads should be added.

Figure 32

$$\text{LC resonant frequency} \quad f_p = \frac{1}{2\pi\sqrt{LC}} \quad [\text{Hz}]$$

$$\text{Phase lead} \quad f_{z1} = \frac{1}{2\pi R1 C1} \quad [\text{Hz}]$$

$$\text{Phase lead} \quad f_{z2} = \frac{1}{2\pi R_{cp} C_{cp}} \quad [\text{Hz}]$$

Set the lead frequency of one of the phases close to the LC resonant frequency for the purpose of canceling the LC resonance.

Note: If high-frequency noise occurs in output, it will pass through capacitor C1 and affect the feedback. To avoid this problem, add resistor R3 of approximately 1kΩ in series with capacitor C1.

(2) Step-down DC/DC block

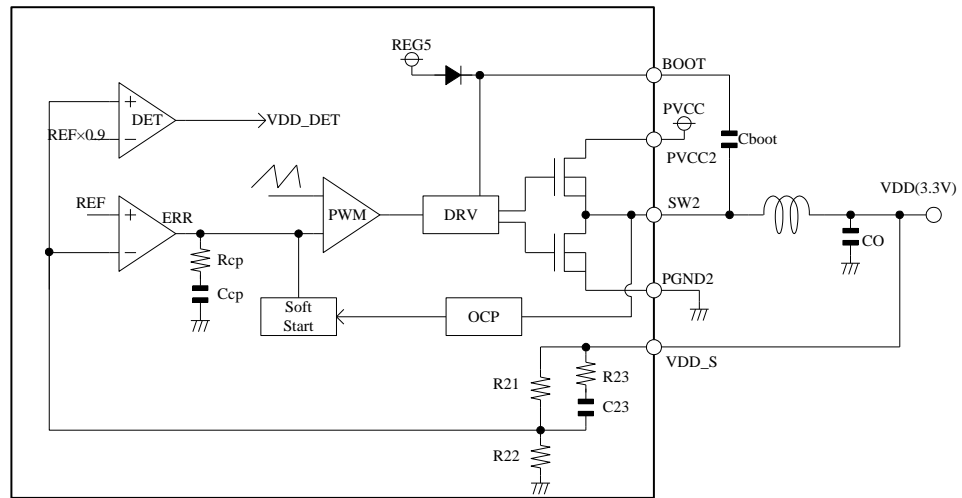

Figure 33. Step-down DC/DC

Step-down DC/DC block incorporates feedback resistor, and output voltage is 3.3V(TYP) fixed. Also, built-in error amp (ERR) phase compensation (Rcp,Ccp) minimizes the external components.

(2.1) Startup sequence

After VIN12V startup, step-down DC/DC starts up with UVLO cancellation as trigger. Soft start function (about 2ms Typ) is built in to limit overshooting while startup.

(2.2) Selecting the output L constant

The inductor to be used for output is determined by the rated current I_{LR} and the maximum input current value I_{OMAX} of the inductor.

Figure 34. Inductor Current Waveform Step-down DC/DC)

Make adjustments so that $I_{OMAX} + \Delta I_L / 2$ will not reach the rated current I_{LR} . At this time, ΔI_L is obtained by the following equation.

$$\Delta I_L = \frac{1}{L} \times (V_{CC} - V_o) \times \frac{V_o}{V_{CC}} \times \frac{1}{f}$$

Wherein f : Switching frequency

In addition, since the inductor L value may have variations in the range of approximately $\pm 30\%$, set this value with sufficient margin. If the inductor current exceeds the rated current I_{LR} , the internal IC element may be damaged because of large rush current.

(2.3) Selecting I/O capacitors

To select I/O capacitors, refer to information in Section (1.3).

However, the output ripple voltage of the step-down DC/DC converter is calculated by the following equation.

$$\Delta V_{PP} = \Delta I_L \times R_{ESR} + \frac{\Delta I_L}{2C_o} \times \frac{V_o}{V_{CC}} \times \frac{1}{f} \quad [V]$$

Cboot is a flying capacitor in bootstrap circuit for driving high side switch. 0.1μF is recommended.

(3) HV_LDO block

Figure 35. HV_LDO block

(3.1) Selecting I/O capacitors

The HV_LDO is ceramic capacitor compatible.

Capacitance in the range of 4.7μF to 10μF is recommended.

(3.2) Output voltage setting

Output voltage is variable output by the external resistor R31,R32.

Output voltage HVLDO is calculated by the equation below.

$$HVLDO = 1.0 \times \frac{R31 + R32}{R32}$$

(3.3) Startup sequence

After under voltage protection for VCC release, starts up with HVCC startup.

(4) LV_LDO block

Figure 36. LV_LDO block

(4.1) Selecting I/O capacitors

LV_LDO is ceramic capacitor compatible.
Capacitance in the range of 4.7 μ F to 10 μ F is recommended.

(4.2) Output voltage setting

Output voltage is switching output by LVCTL pin.

Where LVCTL pin=VIN(PVCC1,2)、	LVLDO output = 1.2[V]
Where LVCTL pin=M (OPEN) 、	LVLDO output = 1.8[V]
Where LVCTL pin= GND、	LVLDO output = 1.5[V]

(4.3) Startup sequence

After under voltage protection for VCC release, starts up with VDD startup.

Figure 37. Positive charge pump block

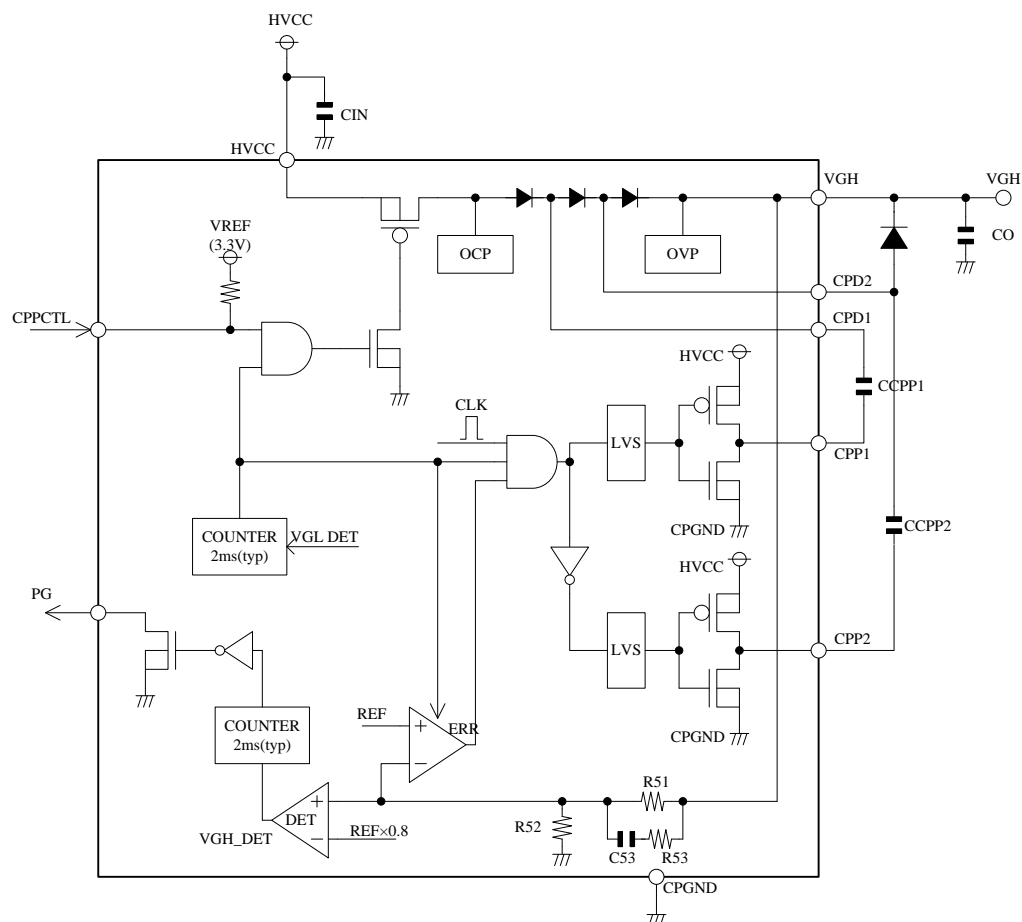

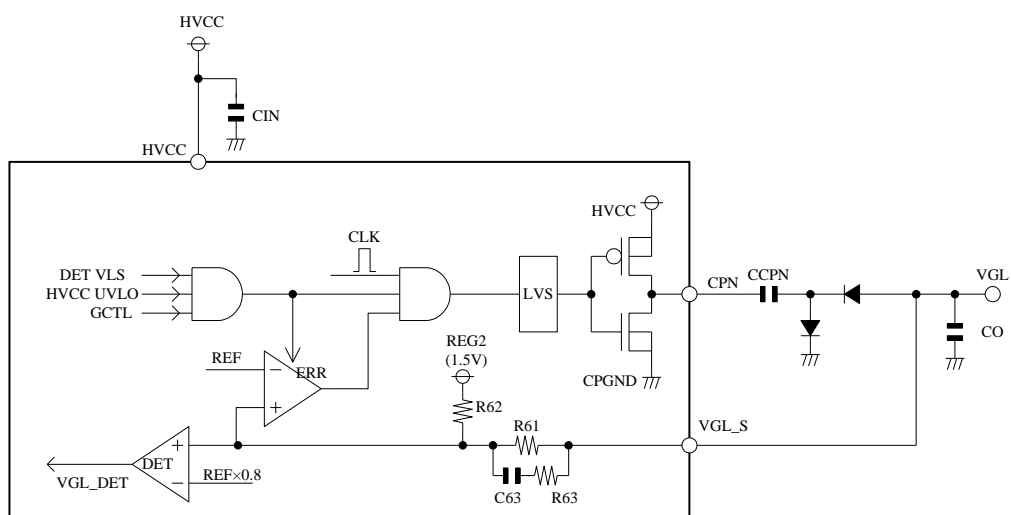

Figure 38. Negative charge pump block

The charge pump block starts operation, when it reaches 90% of Boost DC/DC output, GCTL=High and cancels HVCC low voltage protection. The startup sequences are internally fixed. First, negative-side charge pump starts operation. Next, when the negative-side charge pump reaches 80% of the set voltage, after 2ms (typ), the positive-side charge pump will start operation. When both negative and positive-side charge pumps reach 80% of the set voltage, after 2ms (typ), the power-good signal outputs from the CPPG pin.

The positive-side charge pump have an overvoltage protection function that turns off HVCC-side load switch and prevents overshoot of output voltage, When VGH voltage reaches 37.5V (typ).

(5.1) Selecting output diodes

Select Schottky diodes having a current capability two times (negative side) as high as the maximum output current and a withstand voltage higher than the output voltage.

Due to the aforementioned requirements, it is recommended to use the RB550EA dual Schottky barrier diode.

(5.2) Selecting output capacitors

CCPP1,CCPP2,CCPN is flying capacitor. A capacitance in the range of 0.01 μ F to 1 μ F is recommended.

CO serves as charge pump output capacitors; a capacitance in the range of 0.47 μ F to 10 μ F is recommended.

(5.3) Output voltage setting

Positive charge pump output VGH is 35.2V(TYP) fixed output.

Negative charge pump output VGL is -6V(TYP) fixed output.

(6) Gate shading block

Gate shading block activates when positive charge pump output (VGH) is over 80%, CTL logic comes in.

Inside FET M1 turns ON and FET M2 turns OFF when positive charge pump output (VGH) is below 80%.

When CTL logic is LOW, inside FET M1 turns ON and M2 turns OFF.

When CTL logic is HIGH, inside FET M1 turns OFF and M2 turns ON. While M2 turns ON, if DRN pin voltage reaches ten times of a voltage inputting to THR, M2 turns OFF.

Figure 39. Gate shading block

	VGH voltage under 80%		VGH voltage over 80%	
CTL logic	FET M1	FET M2	FET M1	FET M2
L	ON	OFF	ON	OFF
H	ON	OFF	OFF	ON

Common amplifier

VCOM operates in the range of 0.1V to HVCC-0.8V(TYP). Normally, use the VCOM amplifier as a buffer type amplifier as shown in (a).

Use the output voltage of the HVLDO block for power supply on the reference side.

To increase the current drive capability, use the PNP and NPN transistors as shown in (b).

When the VCOM amplifier is not used, set the block to the buffer type as shown in (a) and ground the INP pin.

In this case, it is recommended to set the RCOM1 and RCOM2 resistors in the range of 10kΩ to 100kΩ .

Setting them to not more than 10kΩ may increase current consumption, thus resulting in degraded power efficiency.

Setting them to not less than 100kΩ may result in higher offset voltage due to the input bias current of 0.1μA (Typ).

(a)

(b)

Figure 40. VCOM

$$VCOM = \frac{RCOM2}{RCOM1 + RCOM2} \times HVLDO$$

(7) DAC block

The serial data control block consists of a register that stores data from the SDA, SCL pins, and a DAC circuit that receives the output from this register and provides adjusted voltages to other IC blocks.

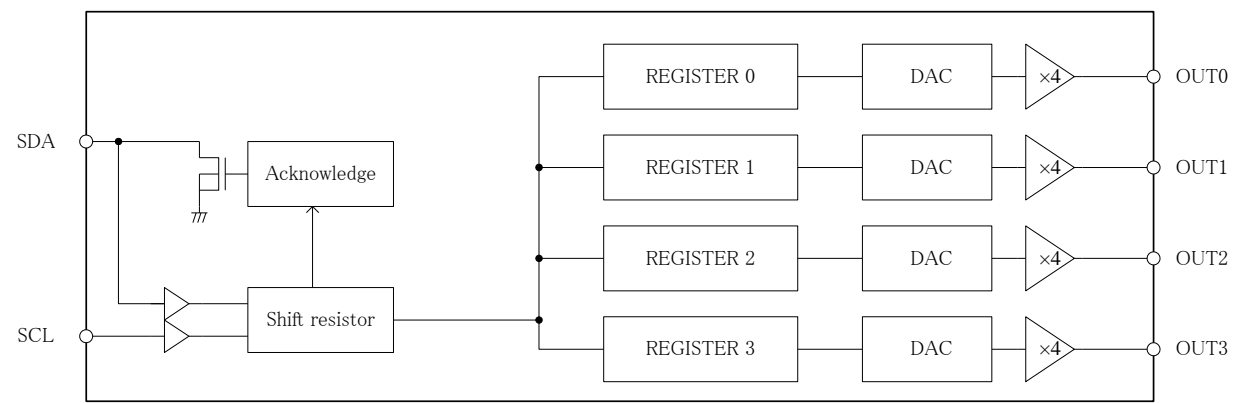

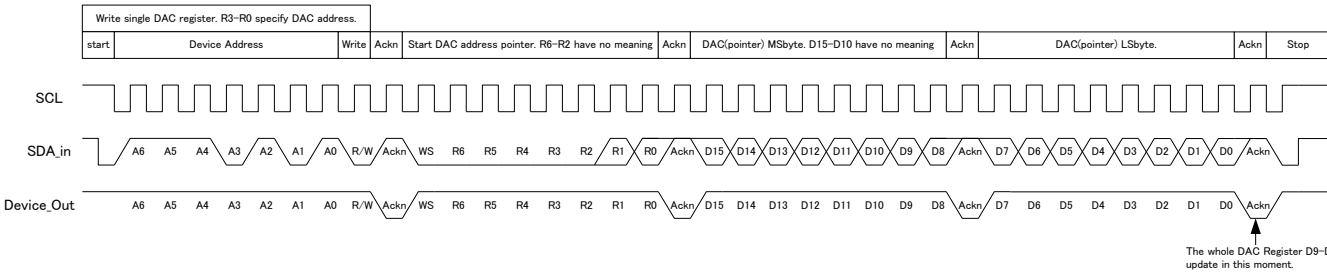

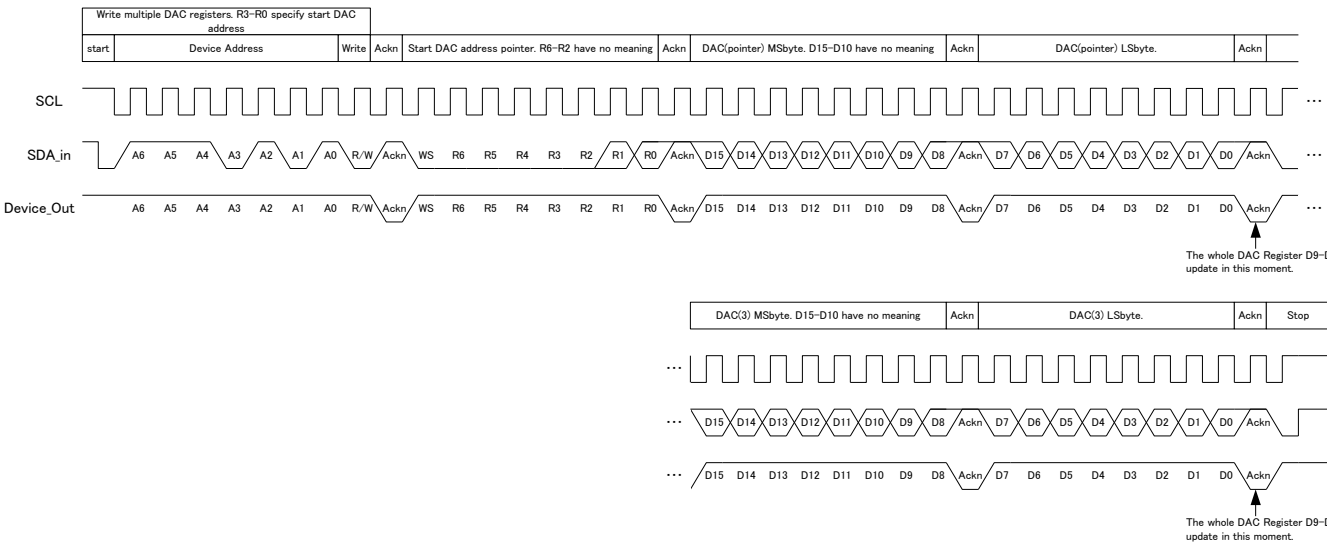

Figure 41. Serial block

- Output Voltage setting mode**
Writes to a register address specified by I²C BUS.
For writing mode from I²C BUS to register, there are (i)Single mode , (ii)Multi mode.
On single mode, write data to one designated register.
On multi mode, as a start address register specified in the second byte of data entry by multiple data write can be performed continuously.
Single mode or multi mode can be configured by having or not having “stop bit”.

(i). Single mode timing chart

(ii). Multi mode timing chart

Resistor address		Register name		BIT								Initial value	Output pin
R1	R0			7	6	5	4	3	2	1	0		
0	0	Register 0	DATA0	X	X	X	X	X	X	D9	D8	02C5h	OUT0
			DATA1	D7	D6	D5	D4	D3	D2	D1	D0		
0	1	Register 1	DATA0	X	X	X	X	X	X	D9	D8	0230h	OUT1
			DATA1	D7	D6	D5	D4	D3	D2	D1	D0		
1	0	Register 2	DATA0	X	X	X	X	X	X	D9	D8	01EDh	OUT2
			DATA1	D7	D6	D5	D4	D3	D2	D1	D0		
1	1	Register 3	DATA0	X	X	X	X	X	X	D9	D8	014Dh	OUT3
			DATA1	D7	D6	D5	D4	D3	D2	D1	D0		

DATA0: Upper 8 bits, DATA1: Lower 8 bits, X: don't care, D9 to D0: Data bit

REGISTER ADDRESS

Device addresses A6 to A0 are specific to the IC and should be set as follows: (A6 to A0) = 1110101.

The lower 2 bits (R1 to R0) of the second byte are used to store the register address. R6 to R2 should be set to 0 as usual.

Command interface

Use I²C BUS for command interface with host. Writing or reading by specifying 1 byte select address, along with slave address. I²C BUS Slave mode format is shown below.

MSB	LSB	MSB	LSB	MSB	LSB			
S	Slave Address	A	Select Address	A	DATA	A	P	

S : Start condition
 Slave Address : After slave mode (7bit),, with read mode (H) or light mode (L), send 8 bit data in all.
 A : Acknowledge Added acknowledge bit per byte in sending and receiving data.
 If the data is sent/ received properly, "L" is send/receives.
 Sending/ Receiving "H" means lack of acknowledge.
 Select Address : Use 1 byte select address.
 DATA : Data byte. Sending/ Receiving data (MSB first)
 P : Stop condition

The case where writing 3FCh to DAC1 (Single mode)

S	Slave Address	A	Select Address	A	Register1 DATA0	A	Register1 DATA1	A	P
(ex.)	EAh		01h		03h		FCh		

: Slave from master
 Master from slave

The case where writing 3FCh from DAC0 to DAC3 (Multi mode)

S	Slave Address	A	Select Address	A	Register 0 DATA0	A	Register 0 DATA1	A	Register 1 DATA0	A	Register1 to 3 DATA0,DATA1	A	P
(ex.)	EAh		00h		03h		FCh		03h				

: Slave from master
 Master from slave

• Buffer output setting

The relation between buffer output voltage (OUT0 to OUT3) and DAC setting value is shown below.

$$\text{Output voltage (OUT0 to OUT3)} = \frac{\text{DAC setting value} + 1}{1024} \times \text{HVLDO}$$

Buffer output terminals OUT0 to OUT3 output after UVLO release of HVCC.
While UVLO detection, the output is HiZ.

(8) Common block

(8.1) UVLO function

When VCC is below 8.0V(TYP), UVLO function activates and be canceled when VCC is over 8.4V(TYP).

(8.2) SCP function

Figure 42. SCP

The SCP function protects against short-circuits in the outputs of the step-up DC/DC converter, step-down DC/DC converter, HV_LDO, LV_LDO and charge pump blocks. When any one of these outputs falls below 60% of the set voltage, it will be regarded as a short-circuit in output, thus activating the short-circuit protection function.

If a short-circuit is detected, source current of 5 μA (Typ) will be output from the SCP pin. Then, delay time will be set with external capacitance. When the SCP pin voltage exceeds 1.5V (Typ), the state will be latched to shut down all outputs. Once the state has been latched, it will not be canceled unless VCC restarts. The delay time setting is obtained by using the following equation.

$$TL[s] = \frac{C_{SCP} \times 1.5}{5 \times 10^{-6}}$$

Even if none of the output startup sequences is complete at startup of the IC, short-circuits will be detected and the SCP function activated. For this reason, set the delay time substantially longer than the startup time.

Operational Notes

1. Reverse Connection of Power Supply

Connecting the power supply in reverse polarity can damage the IC. Take precautions against reverse polarity when connecting the power supply, such as mounting an external diode between the power supply and the IC's power supply pins.

2. Power Supply Lines

Design the PCB layout pattern to provide low impedance supply lines. Separate the ground and supply lines of the digital and analog blocks to prevent noise in the ground and supply lines of the digital block from affecting the analog block. Furthermore, connect a capacitor to ground at all power supply pins. Consider the effect of temperature and aging on the capacitance value when using electrolytic capacitors.

3. Ground Voltage

Ensure that no pins are at a voltage below that of the ground pin at any time, even during transient condition.

4. Ground Wiring Pattern

When using both small-signal and large-current ground traces, the two ground traces should be routed separately but connected to a single ground at the reference point of the application board to avoid fluctuations in the small-signal ground caused by large currents. Also ensure that the ground traces of external components do not cause variations on the ground voltage. The ground lines must be as short and thick as possible to reduce line impedance.

5. Thermal Consideration

Should by any chance the maximum junction temperature rating be exceeded the rise in temperature of the chip may result in deterioration of the properties of the chip. In case of exceeding this absolute maximum rating, increase the board size and copper area to prevent exceeding the maximum junction temperature rating.

6. Recommended Operating Conditions

These conditions represent a range within which the expected characteristics of the IC can be approximately obtained. The electrical characteristics are guaranteed under the conditions of each parameter.

7. Inrush Current

When power is first supplied to the IC, it is possible that the internal logic may be unstable and inrush current may flow instantaneously due to the internal powering sequence and delays, especially if the IC has more than one power supply. Therefore, give special consideration to power coupling capacitance, power wiring, width of ground wiring, and routing of connections.

8. Operation Under Strong Electromagnetic Field

Operating the IC in the presence of a strong electromagnetic field may cause the IC to malfunction.

9. Testing on Application Boards

When testing the IC on an application board, connecting a capacitor directly to a low-impedance output pin may subject the IC to stress. Always discharge capacitors completely after each process or step. The IC's power supply should always be turned off completely before connecting or removing it from the test setup during the inspection process. To prevent damage from static discharge, ground the IC during assembly and use similar precautions during transport and storage.

10. Inter-pin Short and Mounting Errors

Ensure that the direction and position are correct when mounting the IC on the PCB. Incorrect mounting may result in damaging the IC. Avoid nearby pins being shorted to each other especially to ground, power supply and output pin. Inter-pin shorts could be due to many reasons such as metal particles, water droplets (in very humid environment) and unintentional solder bridge deposited in between pins during assembly to name a few.

11. Unused Input Pins

Input pins of an IC are often connected to the gate of a MOS transistor. The gate has extremely high impedance and extremely low capacitance. If left unconnected, the electric field from the outside can easily charge it. The small charge acquired in this way is enough to produce a significant effect on the conduction through the transistor and cause unexpected operation of the IC. So unless otherwise specified, unused input pins should be connected to the power supply or ground line.

Operational Notes – continued

12. Regarding the Input Pin of the IC

This monolithic IC contains P⁺ isolation and P substrate layers between adjacent elements in order to keep them isolated. P-N junctions are formed at the intersection of the P layers with the N layers of other elements, creating a parasitic diode or transistor. For example (refer to figure below):

When GND > Pin A and GND > Pin B, the P-N junction operates as a parasitic diode.

When GND > Pin B, the P-N junction operates as a parasitic transistor.

Parasitic diodes inevitably occur in the structure of the IC. The operation of parasitic diodes can result in mutual interference among circuits, operational faults, or physical damage. Therefore, conditions that cause these diodes to operate, such as applying a voltage lower than the GND voltage to an input pin (and thus to the P substrate) should be avoided.

Figure 43. Example of monolithic IC structure

13. Thermal Shutdown Circuit(TSD)

This IC has a built-in thermal shutdown circuit that prevents heat damage to the IC. Normal operation should always be within the IC's power dissipation rating. If however the rating is exceeded for a continued period, the junction temperature (T_j) will rise which will activate the TSD circuit that will turn OFF all output pins. When the T_j falls below the TSD threshold, the circuits are automatically restored to normal operation.

Note that the TSD circuit operates in a situation that exceeds the absolute maximum ratings and therefore, under no circumstances, should the TSD circuit be used in a set design or for any purpose other than protecting the IC from heat damage.

14. Over Current Protection Circuit (OCP)

This IC incorporates an integrated overcurrent protection circuit that is activated when the load is shorted. This protection circuit is effective in preventing damage due to sudden and unexpected incidents. However, the IC should not be used in applications characterized by continuous operation or transitioning of the protection circuit.

15. DC/DC switching line wiring pattern

DC/DC converter switching line (wiring from switching pin to inductor, Nch MOS) should be connected with short and wide wiring. If the wiring is long, ringing by switching would increase. That may cause excess voltage of absolute maximum ratings. If the wiring is obliged to lengthen by parts location limits, please consider inserting snubber circuit.

16. Discontinuous mode

The step-up and step-down DC/DC converters used in this IC have been designed on the assumption that the converters are used in continuous mode. Using the IC constantly while in discontinuous mode may result in malfunctions. To avoid this problem, make coil adjustments or insert a resistor between output and GND to prevent the IC from entering discontinuous mode while in use.

Notice

Precaution on using ROHM Products

- Our Products are designed and manufactured for application in ordinary electronic equipments (such as AV equipment, OA equipment, telecommunication equipment, home electronic appliances, amusement equipment, etc.). If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment ^(Note 1), transport equipment, traffic equipment, aircraft/spacecraft, nuclear power controllers, fuel controllers, car equipment including car accessories, safety devices, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM's Products for Specific Applications.

(Note1) Medical Equipment Classification of the Specific Applications

JAPAN	USA	EU	CHINA
CLASS III	CLASS III	CLASS II b	CLASS III
CLASS IV		CLASS III	

- ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
 - Installation of protection circuits or other protective devices to improve system safety
 - Installation of redundant circuits to reduce the impact of single or multiple circuit failure
- Our Products are designed and manufactured for use under standard conditions and not under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM's Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc. prior to use, must be necessary:
 - Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
 - Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
 - Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl₂, H₂S, NH₃, SO₂, and NO₂
 - Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
 - Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
 - Sealing or coating our Products with resin or other coating materials
 - Use of our Products without cleaning residue of flux (even if you use no-clean type fluxes, cleaning residue of flux is recommended); or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
 - Use of the Products in places subject to dew condensation
- The Products are not subject to radiation-proof design.
- Please verify and confirm characteristics of the final or mounted products in using the Products.
- In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse. is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.
- De-rate Power Dissipation depending on ambient temperature. When used in sealed area, confirm that it is the use in the range that does not exceed the maximum junction temperature.
- Confirm that operation temperature is within the specified range described in the product specification.
- ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

Precaution for Mounting / Circuit board design

- When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.
- In principle, the reflow soldering method must be used on a surface-mount products, the flow soldering method must be used on a through hole mount products. If the flow soldering method is preferred on a surface-mount products, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification

Precautions Regarding Application Examples and External Circuits

1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.
2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

Precaution for Electrostatic

This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of ionizer, friction prevention and temperature / humidity control).

Precaution for Storage / Transportation

1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
 - [a] the Products are exposed to sea winds or corrosive gases, including Cl₂, H₂S, NH₃, SO₂, and NO₂
 - [b] the temperature or humidity exceeds those recommended by ROHM
 - [c] the Products are exposed to direct sunshine or condensation
 - [d] the Products are exposed to high Electrostatic
2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.
3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.
4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

Precaution for Product Label

A two-dimensional barcode printed on ROHM Products label is for ROHM's internal use only.

Precaution for Disposition

When disposing Products please dispose them properly using an authorized industry waste company.

Precaution for Foreign Exchange and Foreign Trade act

Since concerned goods might be fallen under listed items of export control prescribed by Foreign exchange and Foreign trade act, please consult with ROHM in case of export.

Precaution Regarding Intellectual Property Rights

1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data.
2. ROHM shall not have any obligations where the claims, actions or demands arising from the combination of the Products with other articles such as components, circuits, systems or external equipment (including software).
3. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the Products or the information contained in this document. Provided, however, that ROHM will not assert its intellectual property rights or other rights against you or your customers to the extent necessary to manufacture or sell products containing the Products, subject to the terms and conditions herein.

Other Precaution

1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.
2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.
3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.
4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.

General Precaution

1. Before you use our Products, you are requested to carefully read this document and fully understand its contents. ROHM shall not be in any way responsible or liable for failure, malfunction or accident arising from the use of any ROHM's Products against warning, caution or note contained in this document.
2. All information contained in this document is current as of the issuing date and subject to change without any prior notice. Before purchasing or using ROHM's Products, please confirm the latest information with a ROHM sales representative.
3. The information contained in this document is provided on an "as is" basis and ROHM does not warrant that all information contained in this document is accurate and/or error-free. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties resulting from inaccuracy or errors of or concerning such information.
