PIN DESCRIPTIONS

Pin No.	Pin Name	I/O	Descriptions
1 2	OSC _{IN} OSC _{OUT}	I O	Oscillator input. Oscillator output. A crystal is placed between OSC _{IN} and OSC _{OUT} .
3	V _P	—	Power supply input for charge pump.
4	V _{CC}	—	Power supply voltage input.
5	D _O	O	Charge pump output. Phase characteristic can be inverted depending upon FC input.
6	GND	—	Ground.
7	LD	O	Phase comparator output. This pin outputs high when the phase is locked. While the phase difference of f _r and f _p exists, the output level goes low.
8	f _{in}	I	Prescaler input. The connection with an external VCO should be an AC connection.
9	Clock	I	Clock input for 19-bit shift register and 16-bit shift register. Each rising edge of the clock shifts one bit of data into the shift registers.
10	Data	I	Serial data of binary code input. The last bit of the data is a control bit. The last data bit specifies which latch is activated. When the last bit is high level and LE is high-level, data is transferred to 15-bit latch. When the last bit is low level and LE is high level, data is transferred to 18-bit latch.
11	LE	I	Load enable input (with internal pull up resistor). When LE is high level (or open), data stored in the shift register is transferred to latch depending on the control data.
12	FC	O	Phase selecting input of phase comparator (with internal pull up resistor). When FC is low level, charge pump and phase detector characteristics can be inverted.
13	f _r	O	Monitor pin of phase comparator input. It is the same as programmable reference divider output.
14	f _p	O	Monitor pin of phase comparator input. It is the same as programmable divider output.
15 16	ØP ØR	O O	Outputs for external charge pump. Phase characteristics can be inverted depending on FC input. ØP pin is an N-channel open-drain output.

FUNCTIONAL DESCRIPTIONS

SERIAL DATA INPUT

Serial data input is input using Data pin, Clock pin and LE pin. The 15-bit programmable reference divider and 18-bit programmable divider are controlled respectively.

On rising edge of the clock shifts one bit of the data into the internal shift registers.

When load enable (LE) is high level (or open), data stored in shift registers is transferred to 15-bit latch or 18-bit latch depending upon the control bit level.

Control data "H" ; Data is transferred into 15-bit latch.

Control data "L" ; Data is transferred into 18-bit latch.

PROGRAMMABLE REFERENCE DIVIDER

Programmable reference divider consists of 16-bit shift register, 15-bit latch and 14-bit reference counter. Serial 16-bit data format is shown below.

SW: Divide ratio of prescaler setting bit.

SW="H" : 64

SW="L" : 128

S₁ to S₁₄: Divide ratio of programmable reference counter setting bits (8 to 16383)

C: Control bit (Control bit is set to high.)

FUNCTIONAL DESCRIPTIONS

PROGRAMMABLE DIVIDER

Programmable divider consists of 19-bit shift register, 18-bit latch, 7-bit swallow counter and 11-bit programmable counter. Serial 19-bit data format is shown below.

S₈ to S₁₈ : Divide ratio of programmable counter setting bits (16 to 2047)

S₁ to S₇ : Divide ratio of swallow counter setting bits (0 to 127)

C: Control bit (Control bit is set to low.)

Data is input from MSB data.

On the rising edge of the clock shifts one bit of the data into the shift registers.
 Parenthesis data is used for setting the divide ratio of the programmable reference divider.

PHASE CHARACTERISTICS

FC pin (pin 12) is provided to inverse the phase comparator characteristics. The characteristics of internal charge pump output (D_O), phase detector outputs ($\emptyset R$, $\emptyset P$) can be inverted depending upon FC input data. Outputs are shown below.

	FC=H (or open)			FC=L		
	D_O	$\emptyset R$	$\emptyset P$	D_O	$\emptyset R$	$\emptyset P$
$f_r > f_p$	H	L	L	L	H	Z
$f_r < f_p$	L	H	Z	H	L	L
$f_r = f_p$	Z	L	Z	Z	L	Z

Note: Z=(High impedance)

VCO CHARACTERISTICS

Depending upon VCO characteristics, FC pin should be set accordingly:

When VCO characteristics are like ①, FC should be set high or open circuit;

When VCO characteristics are like ②, FC should be set Low.
