ANMG08 (8-CH Auto Sensitivity Calibration Capacitive Touch Sensor)

General

The ANMG08 is 8-Channel capacitive sensor with auto sensitivity calibration. And the supply voltage range is from 3.0 to 5.5V.

The ANMG08 offers LED drivers with 16 steps dimming controller. The D[1:8] ports can be used for PWM output for LED dimming control.

The result of touch sensing can be checked by two kind of interface. One is parallel output port(D[1:8]). D[1:8] is touch sensing result of CS[1:8]. The other is I^2C serial interface. I2C interface might be useful when the MCU IO or connector resource is not enough in the application.

The ANMG08 has SCL and SDA for I2C interface. SCL is I^2C clock input pin and SDA is I^2C data input-output pin. These ports have internal pull-up resistor(32KΩ).
In case of not use, this pin must be not connected to any circuitry.

Feature

■ 8-Channel capacitive sensor with auto sensitivity calibration
■ Available LED PWM drive up to 8
■ Multi interface - I2C serial interface / Parallel outputs
■ Selectable output operation mode (Single output / Multi output)
■ Adjustable 256 steps sensitivity
■ Almost no external component needed
■ Low current consumption
■ Embedded common and normal noise elimination circuit
■ RoHS compliant 24SSOP packages
■ Moisture sensitivity level 3 (MSL3)
■ 3.0V to 5.5V operation
■ Power consumption
-   Standby state : 0.50mA (@3.3V)

Block Diagram
Application

■ Multimedia Devices(TV, DVD player, Blueray player, Digital photo frame, Home theater system)
■ Home Appliance(Refrigerator, Air cleaner, Air conditioner, Washing machine, Microwave oven)
■ Sealed control panels, keypads

Content

1   Pin Configuration

ANMG08PL (24-SSOP)

2 Pin Description

VDD, GND
Supply voltage and ground pin.

R.N.D
Radio frequency Noise Detection pin. Normally, R.N.D pin does not connect to anywhere.
But, in radio frequency noise environment, this pin must form a pattern line on PCB.

CS1 ~ CS8
Capacitive sensor input pins.

LCAP
Internal LDO output port.

D1 ~ D8
Parallel output ports of CS1~CS8 respectively / LED PWM drive output ports. The structure of these parallel output ports is open drain NMOS for active low output level operation.

SCL, SDA
SCL is I^2C clock input pin and SDA is I^2C data input-output pin. These ports have internal pull-up resistor.
In case of not use, this pin must be not connected to any circuitry.

INT
Touch sensing interrupt output pin. This port has internal pull-up resistor.

ADSemiconductor®

" Free from Common Mode Noise "

2.1 Pin Map (24SSOP package)

Pin Number	Name	I/O	Description	Protection
1	CS6	Analog Input	Capacitive sensor input 6	VDD/GND
2	CS7	Analog Input	Capacitive sensor input 7	VDD/GND
3	CS8	Analog Input	Capacitive sensor input 8	VDD/GND
4	SCL	Digital Input	I^2C clock input	VDD/GND
5	SDA	Digital Input / Output	I^2C data input-output Open drain NMOS structure	VDD/GND
6	GND	Ground	Supply ground	VDD
7	R.N.D	Analog Input	Radio frequency Noise Detection pin	VDD/GND
8	D1	Digital Output	Parallel output of CS1 LED PWM drive output1 Open drain NMOS structure	VDD/GND

24	CS5	Analog Input	Capacitive sensor input 5	VDD/GND

3 Absolute Maximum Rating

Maximum supply voltage	5.5V
Maximum voltage on any pin	VDD+0.3
Maximum current on any PAD	100mA
Power Dissipation	800mW
Storage Temperature	-50 ~ 150℃
Operating Temperature	-20 ~ 75℃
Junction Temperature	150℃

Note : Unless any other command is noted, all above are operated in normal temperature.

4 ESD & Latch-up Characteristics

4.1 ESD Characteristics

Mode	Polarity	Max	Reference
H.B.M	Pos / Neg	8000V	VDD
		8000V	VSS
		8000V	P to P
M.M	Pos / Neg	550V	VDD
		550V	VSS
		400V	P to P
C.D.M	-	800V	Field Induced Charge

4.2 Latch-up Characteristics

Mode	Polarity	Max	Reference
I Test	Positive	200mA	JESD78D : 2011
	Negative	200mA	
V supply over 5.0V	Positive	8.25V	

5   Electrical Characteristics

■ V_{DD}=3.3V, Typical system frequency (Unless otherwise noted), T_A = 25℃

Characteristics	Symbol	Test Condition	Min	Typ	Max	Units
Power supply requirement and current consumption

Input low level	VIL	$\| I_{IL} \| \leq +5\mu A$	–0.3		V_{DD}*0.3	V
Self calibration time after system reset	T_{CAL}	Slow calibration speed	-	100	-	msec
		Normal calibration speed	-	80	-	
		Fast calibration speed	-	60	-	
Internal Pull Up resister of SDA, SCL, INT	$R_{P/U}$		-	30	-	kΩ
Touch sensing performance						
Minimum detective capacitance difference	ΔC_{MIN}		0.1	-	-	pF
Sense input capacitance range[1]	C_S		-	-	50	pF
Output impedance (open drain)	Zo	$\Delta C > \Delta C_{MIN}$	-	12	-	Ω
		$\Delta C < \Delta C_{MIN}$	-	30M	-	
System performance						
Max. output current (LED drive current)	I_{OUT}	Per unit drive output port	-	-	8.0	mA
LED PWM control[2]	N_{PWM}		-	16	-	step
Sensitivity control[3]			-	256	-	step
Max. I²C SCL clock speed	f_{SCL_MAX}	Maximum internal I²C clock	-	-	2	MHz
Touch expired time	T_{EX}	Normal calibration speed	-	30	-	sec

---

[1]   The sensitivity can be decreased with higher parallel capacitance of CS pin including parasitic capacitance made by neighbor GND or other pattern. The series resistor(under 1kΩ) of CS can be used in noisy condition to avoid mal-function from external surge and ESD.

[2]   Refer to the chapter 8.2.11. LED luminance control register

[3]   Refer to the chapter 8.2.8. Sensitivity register

6 ANMG08 Implementation

6.1 Typical current consumption

ANMG08 uses internal bias circuit, so internal clock frequency and current consumption is fixed and no external bias circuit is needed. Internal clock frequency and calibration speed can be changed by I^2C register setting[4]. Faster calibration speed needs more current consumption than normal or slower calibration speed. Slow calibration speed isn't recommended if it has not problem of current consumption.

Internal bias circuit can make the circuit design simple and reduce external components.

6.2 CS implementation

ANMG08 has 256 step selections of sensitivity and internal surge protection resister. Sensitivity of each sensing channel (CS) can be independently controlled on others. External components of CS pin such as series resistor or parallel capacitor isn't necessary. The parallel parasitic capacitance of CS pins caused by touch line, touch pad and neighbor GND or other pattern may affect sensitivity. The sensitivity will be decreased when bigger parallel parasitic capacitance of CS pin is added.

Parallel capacitor ($C_{S1~S8}$) of CS pin is useful in case of detail sensitivity mediation is required such as for complementation sensitivity difference between channels. Same as above parallel parasitic capacitance, sensitivity will be decreased when a big value of parallel capacitor ($C_{S1~S8}$) is used. Under 50pF capacitor can be used as sensitivity meditation capacitor and a few pF is usually used. The R_S, serial connection resistor of CS pins, may be used to avoid mal-function from external surge and ESD. (It might be optional.) From 200Ω to 1kΩ is recommended for R_S. Refer to below CS pins application figure.
The ANMG08 has eight independent touch sensor input from CS1 to CS8. The internal touch decision process of each channel is separated from others. Therefore eight channel touch key board application can be designed by using only one ANMG08 without coupling problems.

The size and shape of PAD might have influence on the sensitivity. The sensitivity will be optimal when the size of PAD is approximately an half of the first knuckle (it's about 10 ㎜ x 7 ㎜). The connection line of CS to touch PAD is recommended to be routed as short as possible to prevent from abnormal touch detect caused by connection line. The unused CS pin should not be connected with the ground. The unused CS pin(Channel) should be disable[5] or open.

---

[4] Refer to 8.2.4. Clock control register.

[5] Refer to 8.2.1 Channel enable / reset register

6.3 LED drive implementation

ANMG08 has a function to control the LED using D1~D8 ports. For using D1~D8 as LED driver ports, LEDs and resisters must be equipped as below figure, and write the **'port_mode"** register[6] as **'1'**. D1 ~ D8 ports can drive LEDs by **'PWM_ctrlx'** register[7] control. ANMG08 can drive up to 8 LED as below method. The unused Dx port should not be open. The unused Dx port should be connected with VDD or GND.
6.4 Parallel output

ANMG08 acts as active low parallel output mode. Parallel output ports (D1~D8) have an open drain NMOS structure. For this reason, the parallel output mode of ANMG08 needs R_{OUT} as below figures. The maximum output drive current is 8mA, so over a few kΩ must be used as R_{OUT}. Normally 10kΩ is used as R_{OUT}.
The unused Dx port should not be open. The unused Dx port should be connected with VDD or GND.

Active low parallel output mode circuit
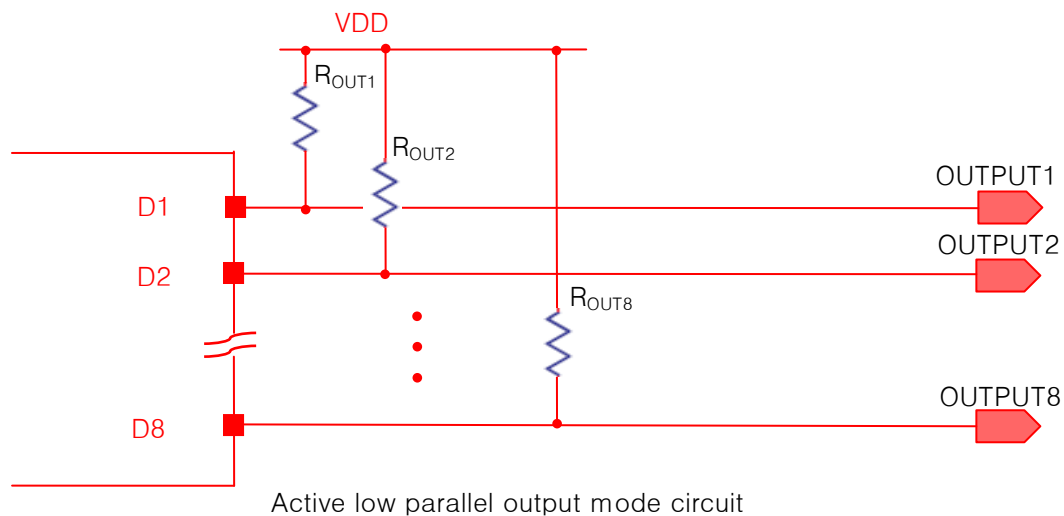

6.5 INT (Interrupt output) Implementation

An INT pin is for the touch sensing interrupt output. The interrupt pulse is generated only during short period of every each channel touch start point and touch end point. Interrupt pulse has logical low level. INT has NMOS open drain structure and internal pull-up resister of which value is 30kΩ typical.

---

[6] Refer to the chapter 8.2.12. Port mode control register

[7] Refer to the chapter 8.2.11. LED luminance control register
6.6   SCL, SDA implementation

SCL is I²C clock input and SDA is I²C data input-output. These ports have internal pull-up resistor. SCL has Schmitt trigger input structure to prevent clock signal from being broken. Maximum supported I²C clock frequency is 2MHz. SDA has NMOS open drain structure and internal pull-up resister of which value is 30kΩ typical. So, according to communication speed a few kΩ resister must be used as pull-up resister for proper data pulse rising time. For more details refer to 'Chapter 9. I²C Interface'.

7 I²C Interface

7.1 I²C Enable / Disable

If the SDA or SCL signal goes to low, I²C control block is enabled automatically. And if the SDA and SCL signal maintain high during about 2 us, I²C control block is disabled automatically also.
7.2 Start & stop condition

◀ Start Condition (S)
◀ Stop Condition (P)
◀ Repeated Start (Sr)
7.3 Data validity

The SDA should be stable when the SCL is high and the SDA can be changed when the SCL is low.

7.4 Byte format

The byte structure is composed with 8Bit data and an acknowledge signal.

7.5 Acknowledge

It is a check bit whether the receiver gets the data from the transmitter without error or not. The receiver will write '0' when it received the data successfully and '1' if not.
7.6　First byte

7.6.1　Slave address

It is the first byte from the start condition. It is used to access the slave device. The initial chip address of ANMG08 is **'48'** hexadecimal number.

7.6.2　R/$\overline{W}$

The direction of data is decided by the bit and it follows the address data.

7.7　Transferring data
7.7.1　Write operation

The byte sequence is as follows:
1. The first byte gives the device address plus the direction bit (R/W = 0).
2. The second byte contains the internal address of the first register to be accessed.
3. The next byte is written in the internal register. Following bytes are written in successive internal registers.
4. The transfer lasts until stop conditions are encountered.
5. The ANMG08 acknowledges every byte transfer.
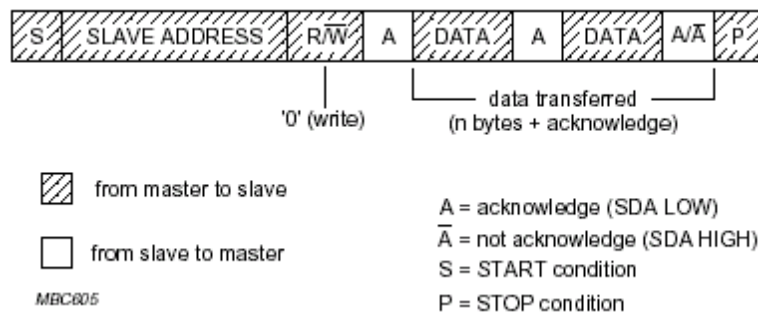

7.7.2　Read operation

The address of the first register to read is programmed in a write operation without data, and terminated by the stop condition. Then, another start is followed by the device address and R/W= 1. All following bytes are now data to be read at successive positions starting from the initial address.

7.7.3　Read/Write Operation
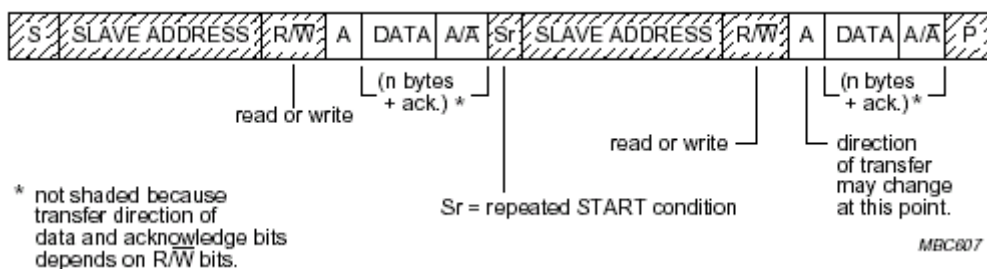

7.8   I²C write and read operations in normal mode

The following figure represents the I²C normal mode write and read registers.

☞ Write register 0x00 to 0x01 with data AA and BB

Start	Device Address 0x48	ACK	Register Address 0x00	ACK	Data AA	ACK	Data BB	ACK	Stop

Read register 0x00 and 0x01

Start	Device Address 0x48	ACK	Register Address 0x00	ACK	Stop

Start	Device Address 0x49	ACK	Data Read AA	ACK	Data Read BB	$\overline{ACK}$	Stop

	From Master to Slave		From Slave to Master

7.9   I²C timing diagram

8   ANMG08 control register list

◀ Note 1 : The unused bits (defined as reserved), in I2C register must be kept to the reset value or refer to the details.

◀ Note 2 : ANMG08 has the special function registers (not be published) that are useful to improve the noise immunity from the CS, RF and so on. And these registers must be kept to the reset value except the case our company recommended. Please refer to the application note if any noise (CS, RF and etc) problem is issued.

8.2 Details

8.2.1 Channel enable / reset register

Type: R/W

Address	Register Name	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
01h	ch_enable /soft_rst	ch8_en	ch7_en	ch6_en	ch5_en	ch4_en	ch3_en	ch2_en	ch1_en

Description

Enable, disable and reset of each channel control register.

Bit name	Reset value	Function
chx_en	1	Channel enable / disable and Channel reset (chx_en is control bit for CSx channel) ♦ 0 : Channel disable and sensing channel reset ♦ 1 : Channel enable

8.2.2 I²C address of ANMG08

Type: R/W

Address	Register Name	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
06h	i2c_id				i2c_id				wr_bit

Description

Chip address of ANMG08 control register.

Bit name	Reset value	Function
wr_bit	0	Write/Read address selection - 0 : Write address, 1 : Read address
i2c_id	0100100	Chip address of ANMG08.

8.2.3 Output data

Type: R

Address	Register Name	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
2Ah	output	o_ch8	o_ch7	o_ch6	o_ch5	o_ch4	o_ch3	o_ch2	o_ch1

Description

The output data register from channel 1 to channel 8.

Bit name	Reset value	Function
o_chx	Read only	o_chx is output bit for CSx channel ♦ 0 : No touch detected ♦ 1 : Touch detected

8.2.4 Clock control register

Type: R/W

Address	Register Name	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
34h	clock_ctrl		init_cal_opt		Reserved	clk_sel		rb_sel	

Description

This register controls the global options of ANMG08

The reserved bits, [Bit4] of the register address 34h, is recommended that you set to '0'.

Bit name	Reset value	Function
rb_sel[8]	10	ANMG08 provides three internal calibration speeds with this register. ✦ 00, 01 : Fast ✦ 10 : Normal ✦ 11 : Slow
clk_sel	01	ANMG08 provides four internal calibration speeds with this register. ✦ 00 : Fast ✦ 01 : Normal ✦ 10 : Slow ✦ 11 : Slowest
init_cal_opt	000	To control the initial BF time. ✦ (init_cal_opt[2:0]+1) * 320 *1-Period[9] (ms)

8.2.5 Global option control register 1

Type: R/W

Address	Register Name	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
36h	global_ctrl1		response_off_ctrl			response_ctrl		bf_mode	software_rst

Description

This register controls the global options of ANMG08

Bit name	Reset value	Function
software_rst	0	Software reset control bit. Reset the data of all sensing channel. ✦ 0 : No reset ✦ 1 : Reset
bf_mode	0	Operation mode selection ● 0 : Normal mode ● 1 : BF mode
response_ctrl	011	Numbers of continuous touch detections for touch decision. ✦ response_ctrl[2:0] + 1 (Maximum time : 7)
response_off_ctrl	010	Numbers of continuous touch off detections for touch off decision. ✦ response_off_ ctrl[2:0] + 1 (Maximum time : 7)

---

[8] The rb_sel register changes the sensitivity of all channels slightly. Slow setting tend to be more sensitive. Fast setting tend to be more insensitive.

[9] 1-Period means that the time from the current sensing burst to the next sensing burst. And the number, 320 is the time control constant value.

8.2.6 State count control register

Type: R/W

Address	Register Name	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
37h	**state_count**	1	1	1	cal_pre_scaler				

Description

Register to set the pre-scaler for the calibration speed.

Bit name	Reset value	Function
cal_pre_scaler	1 1111	The pre-scaler for the calibration speed. ↓ cal_pre_scaler[4:0] *1-Period (ms)

8.2.7 Global option control register 2

Type: R/W

Address	Register Name	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
38h	**global_ctrl2**	imp_sel	sin_multi_mode	cal_hold_time				Reserved	clk_off

Description

This register controls the global options of ANMG08.

The reserved bits, [Bit1] of the register address 38h, is recommended that you set to '0'.

Bit name	Reset value	Function
clk_off	0	System clock off control bit. ↓ 0 : Not clock off ↓ 1 : Clock off
cal_hold_time	1111	Output expiration Time control. ↓ cal_hold_time[3:0] * 512^{10} * 1-Period (ms) ↓ The output expiration time is infinite when the data of the "cal_hold_time" is "0000".
sin_multi_mode	0	Single/Multi output operation mode selection bit. ↓ 0 : Multi output mode ↓ 1 : Single output mode
imp_sel	1	Impedance of the sensing wire of all channels control bit. ↓ 0 : High impedance ↓ 1 : Low impedance except sensing period.

---

[10] The number, 512 is the time control constant value.

8.2.8   Sensitivity register

Type: R/W

Address	Register Name	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
39H	sensitivity1				sensitivity01				
3AH	sensitivity2				sensitivity02				
3BH	sensitivity3				sensitivity03				
3CH	sensitivity4				sensitivity04				
3DH	sensitivity5				sensitivity05				
3EH	sensitivity6				sensitivity06				
3FH	sensitivity7				sensitivity07				
40H	sensitivity8				sensitivity08				

Description

The sensitivity of channel is possible to adjust by the "sensitivity1~sensitivity8" registers. The following table show detail information of sensitivity.

The lower value of these register ANMG08 has, the higher sensitivity ANMG08 has. And if user want to set higher sensitivity over 0.7%, it is recommended to refer to the application note.

Bit name	Reset value	Function
sensitivity0x	0001 1100	Sensitivities of each channel. Sensitivity of CSx channel: {(sensitivity0x[7:0] x 0.025)} (%).

8.2.9   Calibration speed control register

Type: R/W

Address	Register Name	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
41H	cal_speed	rnd_bf_up		rnd_bf_down		sen_bf_up		sen_bf_down	

Description

Calibration speed can be controlled by this 'cal_speed' register at BF mode.

Bit name	Reset value	Function
sen_bf_down	10	Sense channel down calibration speed at BF mode control bits. ♦ 00 : Fastest ♦ 01 : Fast ♦ 10 : Normal ♦ 11 : Slow
sen_bf_up	01	Sense channel up calibration speed at BF mode control bits. ♦ 00 : Fastest ♦ 01 : Fast ♦ 10 : Normal ♦ 11 : Slow
rnd_bf_down	10	RND channel down calibration speed at BF mode control bits. ♦ 00 : Fastest ♦ 01 : Fast ♦ 10 : Normal ♦ 11 : Slow
rnd_bf_up	01	RND channel up calibration speed at BF mode control bits. ♦ 00 : Fastest ♦ 01 : Fast ♦ 10 : Normal ♦ 11 : Slow

8.2.10 Calibration speed control register at BS mode

Type: R/W

Address	Register Name	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
42H	**cal_BS_speed**	rnd_bs_up		rnd_bs_down		sen_bs_up		sen_bs_down	

Description

Calibration speed can be controlled by this 'cal_BS_speed' register at BS mode.

Bit name	Reset value	Function
sen_bs_down	10	Sense channel down calibration speed at BS mode control bits. ↓ 00 : Fastest ↓ 01 : Fast ↓ 10 : Normal ↓ 11 : Slow
sen_bs_up	01	Sense channel up calibration speed at BS mode control bits. ↓ 00 : Fastest ↓ 01 : Fast ↓ 10 : Normal ↓ 11 : Slow
rnd_bs_down	10	RND channel down calibration speed at BS mode control bits. ↓ 00 : Fastest ↓ 01 : Fast ↓ 10 : Normal ↓ 11 : Slow
rnd_bs_up	01	RND channel up calibration speed at BS mode control bits. ↓ 00 : Fastest ↓ 01 : Fast ↓ 10 : Normal ↓ 11 : Slow

8.2.11 LED luminance control register

Type: R/W

Address	Register Name	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
43h	**PWM_ctrl1**	pwm_d2				pwm_d1			
44h	**PWM_ctrl2**	pwm_d4				pwm_d3			
45h	**PWM_ctrl3**	pwm_d6				pwm_d5			
46h	**PWM_ctrl4**	pwm_d8				pwm_d7			

Description

LED luminance can be controlled by "PWM_ctrlx" register.

Bit name	Reset value	Function
pwm_dx	0000	The LED PWM control bits of Dx port. ↓ 0000 : The minimum low duty ↓ 1111 : The maximum low duty

8.2.12 Port mode control register

Type: R/W

Address	Register Name	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
4Fh	**port_mode**	pmod_d 8	pmod_d 7	pmod_d 6	pmod_d 5	pmod_d 4	pmod_d 3	pmod_d 2	pmod_d 1

Description

This register controls the mode of output port.

Bit name	Reset value	Function
pmod_dx	0	Select the output port operation mode of each channel. ✦ 0 : Parallel output mode ✦ 1 : LED drive mode

8.2.13 Sense, reference count read register

Type: R

| Address	Register Name	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
50h	rd_ch_H1	rd_ch_H1							
51h	rd_ch_L1	-	-	-	-	-	-	rd_ch_L1	
52h	Percent_H	touch_percent[25:18]							
53h	Percent_M	touch_percent[17:10]							
54h	Percent_L	touch_percent[9:2]							
56h	rd_ch_H2	rd_ch_H2							
57h	rd_ch_L2	-	-	-	-	-	-	rd_ch_L2	

Description

ANMG08 provides the special function to read sense count of each channels or reference count.

Bit name	Reset value	Function
rd_ch_H1	Read only	Read channel indication register. ♦ 00000001 : - ♦ 00000010 : R.N.D channel ♦ 00000100 : CS1 channel ♦ 00001000 : CS2 channel ♦ 00010000 : CS3 channel ♦ 00100000 : CS4 channel ♦ 01000000 : CS5 channel ♦ 10000000 : CS6 channel
rd_ch_L1	Read only	Read channel indication register. ♦ 01 : CS7 channel ♦ 10 : CS8 channel
touch_percent[24:17]	Read only	The percent data of RND channel and sense channels. ♦ [25:18] bits of the touch percent data.
touch_percent[16:9]	Read only	The percent data of RND channel and sense channels. ♦ [17:10] bits of the touch percent data.
touch_percent[8:1]	Read only	The percent data of RND channel and sense channels. ♦ [9:2] bits of the touch percent data.
rd_ch_H2	Read only	Read channel indication register. ♦ 00000001 : - ♦ 00000010 : R.N.D channel ♦ 00000100 : CS1 channel ♦ 00001000 : CS2 channel ♦ 00010000 : CS3 channel ♦ 00100000 : CS4 channel ♦ 01000000 : CS5 channel ♦ 10000000 : CS6 channel
rd_ch_L2	Read only	Read channel indication register. ♦ 01 : CS7 channel ♦ 10 : CS8 channel

## 9 Recommended Circuit Diagram

9.1 ANMG08PL (24 SSOP)
ANMG08PL (24 SSOP) Application Example Circuit

✓ ANMG08PL is reset by internal reset circuit. VDD voltage rising time should be shorter than 100msec for proper operation.

✓ LCAP voltage should be bigger than 'minimum digital operating voltage' for normal reset operation when VDD voltage arrived at reset voltage. (# Minimum digital operating voltage : 0.9~1.4V)

✓ Normally, RND's capacitance have to be similar to capacitance of other channels(CS1~CS8). Therefore, RND pin have to connect with a proper capacitor(CS0). Additionally, in radio frequency noise environment, RND pin must form a pattern line on PCB.

✓ The VDD periodic voltage ripple over 50mV and the ripple frequency is lower than 10 kHz can cause wrong sensitivity calibration. To prevent above problem, power (VDD, GND) line of touch circuit should be separated from other circuit. Especially LED driver power line or digital switching circuit power line certainly should be treated to be separated from touch circuit.

✓ The CS patterns also should be routed as short as possible and the width of line might be about 0.25mm.

✓ Parallel capacitor of CS pin could be useful in case detail sensitivity mediation is required such as for complementation sensitivity difference between channels.

✓ Serial connection resistor of CS pins may be used to avoid mal-function from external surge and ESD and the closer to IC(ANMG08PL), the stronger immunity against mal-function and ESD is.

✓ The CVDD capacitor that is between VDD and GND is an obligation.

✓ CVDD and CLCAP capacitors should be located as close as possible from ANMG08PL.

✓ The CS pattern routing should be formed by bottom metal (opposite metal of touch PAD).

✓ The empty space of PCB must be filled with GND pattern to strengthen GND pattern and to prevent external noise from interfere with sensing frequency.

✓ If VDD rising speed is very fast, about 200nF capacitor between VDD and LCAP is necessary for normal reset operation.

9.2 Example – Power Line Split Strategy PCB Layout

**A. Not split power Line (Bad power line design)**
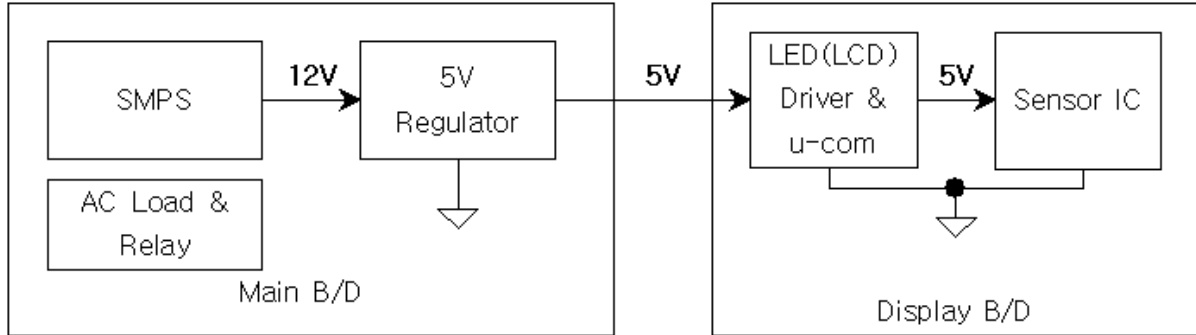

- ✓ The noise that is generated by AC load or relay can be loaded at 5V power line.
- ✓ A big inductance might be appeared in case of the connection line between main board and display board is too long, moreover the voltage ripple could be generated by LED (LCD) display driver at VDD (5V).

**B. Split power Line (One 5V regulator used) – Recommended**
C. Split power Line (Separated 5V regulator used) – Strongly recommended
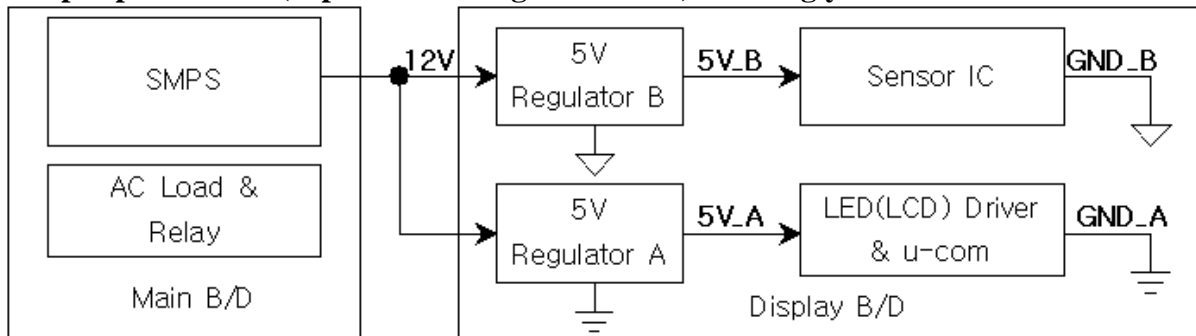

10 MECHANICAL DRAWING

10.1 Mechanical Drawing of ANMG08PL (24 SSOP)

DETAIL : A

SYMBOLS	MIN.	NOM.	MAX.
A	1.35	1.63	1.75
A1	0.10	0.15	0.25
A2	–	–	1.50
D	8.56	8.66	8.74
E	5.79	5.99	6.20
E1	3.81	3.91	3.99
b	0.20	–	0.30
C	0.18	–	0.25
e	0.64 BASIC		
L	0.41	0.64	1.27
L1	1.04 BASIC		
θ°	0°	–	8°

UNIT : MM

NOTES:

1. JEDEC OUTLINE : MO-137 AE

2. DIMENSION D DOES NOT INCLUDE MOLD PROTRUSIONS OR GATE BURRS. MOLD PROTRUSIONS AND GATE BURRS SHALL NOT EXCEED 0.15 MM PER SIDE. DIMENSION E1 DOES NOT INCLUDE INTERLEAD MOLD PROTRUSIONS. INTERLEAD MOLD PROTRUSIONS SHALL NOT EXCEED 0.25 MM PER SIDE.

3. DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION/INTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.10 MM TOTAL IN EXCESS OF b DIMENSION AT MAXIMUM MATERIAL CONDITION. DAMBAR INTRUSION SHALL NOT REDUCE DIMENSION b BY MORE THAN 0.05 MM AT LEAST.

11 MARKING DESCRIPTION

11.1 Marking Description of ANMG08PL (24 SSOP)

Company Code **:** **ADS**

→ **AD Semiconductor**

Device Code **:** **ANMG 08 PL**

→ **Package Type**
→ **Channel Number**
→ **Touch Switch Group**

Year / Week Code **:** **YY WW**

→ **Manufacturing Week**
→ **Manufacturing Year**
