

**SI-3000J Series****5-Terminal, Multi-Function, Full-Mold, Low Dropout Voltage Dropper Type****■Features**

- Compact full-mold package (equivalent to TO220)
- Output current: 2.0A
- Low dropout voltage:  $V_{DIF} \leq 1V$  (at  $I_o=2.0A$ )
- Variable output voltage (rise only) May be used for remote sensing
- Output ON/OFF control terminal is compatible with LS-TTL. (It may be directly driven by LS-TTL or standard CMOS logic.)
- Built-in foldback overcurrent, overvoltage, thermal protection circuits

**■Applications**

- For stabilization of the secondary stage of switching power supplies
- Electronic equipment

**■Absolute Maximum Ratings**

(Ta=25°C)

Parameter	Symbol	Ratings			Unit
		SI-3050J	SI-3090J	SI-3120J/3150J	
DC Input Voltage	V <sub>IN</sub>	25	30	35	V
Voltage of Output Control Terminal	V <sub>c</sub>		V <sub>IN</sub>		V
DC Output Current	I <sub>o</sub>		2.0 <sup>*1</sup>		A
Power Dissipation	P <sub>D1</sub>	20(With infinite heatsink)			W
	P <sub>D2</sub>	1.5(Without heatsink, stand-alone operation)			W
Junction Temperature	T <sub>j</sub>	−40 to +125			°C
Ambient Operating Temperature	T <sub>op</sub>	−30 to +100			°C
Storage Temperature	T <sub>stg</sub>	−40 to +125			°C
Thermal Resistance (junction to case)	R <sub>th(j-c)</sub>	5.0			°C/W
Thermal Resistance (junction to ambient air)	R <sub>th(j-a)</sub>	66.7(Without heatsink, stand-alone operation)			°C/W

## ■Electrical Characteristics

Conditions V <sub>C</sub> =0.4V															

<sup>\*1</sup>: V<sub>IN(max)</sub> and I<sub>O(max)</sub> are restricted by the relation P<sub>D(max)</sub>=(V<sub>IN</sub>-V<sub>O</sub>)•I<sub>O</sub>=20(W).<sup>\*2</sup>: Refer to the dropout voltage.(Refer to Setting DC Input Voltage on page 7.)<sup>\*3</sup>: I<sub>S1</sub> is specified at -5% drop point of output voltage V<sub>O</sub> on the condition that V<sub>IN</sub>=V<sub>O</sub>+3V, I<sub>O</sub>=0.5A.<sup>\*4</sup>: Output is ON even when output control terminal V<sub>C</sub> is open. Each input level is equivalent to LS-TTL. Therefore, it may be directly driven by an LS-TTL circuit.<sup>\*5</sup>: A foldback type overcurrent protection circuit is built into the I<sub>C</sub> regulator. Therefore, avoid using it for the following applications as it may cause starting errors:

- (1) Constant current load
- (2) Plus/minus power
- (3) Series power
- (4) V<sub>O</sub> adjustment by raising ground voltage

■Block Diagram

■Standard External Circuit

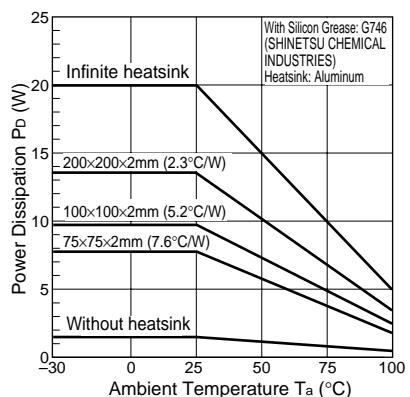

$C_0$  : Output capacitor (47 to 100 $\mu$ F)

\*1  $C_1 \left\{ \begin{array}{l} \text{: Oscillation prevention capacitor } (C_1: \text{Approx. } 47\mu\text{F}, \\ C_2: 0.33\mu\text{F}) \end{array} \right.$

These capacitors are required if the input line is inductive and in the case of long wiring. Tantalum capacitors are recommended for  $C_1$  and  $C_0$ , particularly at low temperatures.

\*2  $D_1$  : Protection diode

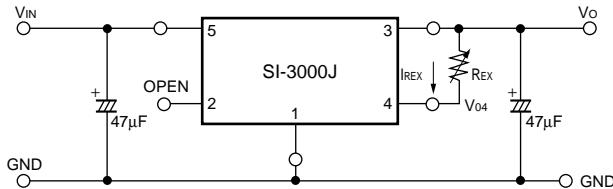

This diode is required for protection against reverse biasing of the input and output. Sanken EU2Z is recommended.

**■Ta-PD Characteristics**

$$P_D = I_o \cdot [V_{IN}(\text{mean}) - V_o]$$

## External Variable Output Voltage Circuit

### 1. Variable output voltage with a single external resistor

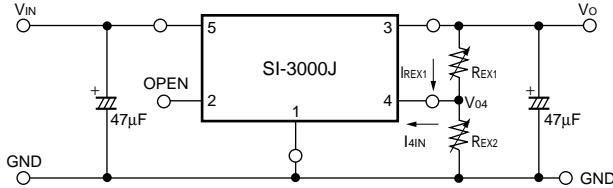

The output voltage may be increased by inserting resistor  $R_{EX}$  between terminals No.4 (sensing terminal) and No.3 (output terminal). The current  $I_{REX}$  flowing into terminal No.4 is 1mA (typ.), therefore the adjusted output voltage  $V_{OUT}$  is:

$$V_{OUT} = V_{O4} + I_{REX} \cdot R_{EX} \quad *V_{O4}: \text{output voltage of SI-3000J series}$$

However, the built-in resistor (between terminals No. 4 and No.1) is a semiconductor resistor, which has approximately thermal characteristics of  $+0.2\%/\text{°C}$ .

It is important to keep the thermal characteristics in mind when adjusting the output voltage.

### 2. Variable output voltage with two external resistors

The output voltage may be increased by inserting resistors  $R_{EX1}$  between terminals No.4 (sensing terminal) and No.3 (output terminal) and  $R_{EX2}$  between terminals No.4 and No.1 (ground terminal).

The current  $I_{4IN}$  flowing into terminal No.4 is 1mA (typ.) so the thermal characteristics may be improved compared to the method shown in 1 by setting the external current  $I_{REX1}$  at approximately 5 times the value of  $I_{4IN}$  (stability coefficient  $S=5$ ).

The adjusted output voltage  $V_{OUT}$  in this case is:

$$\begin{cases} V_{OUT} = V_{O4} + R_{EX1} \cdot I_{REX1} \\ I_{REX1} = S \cdot I_{4IN} \end{cases}$$

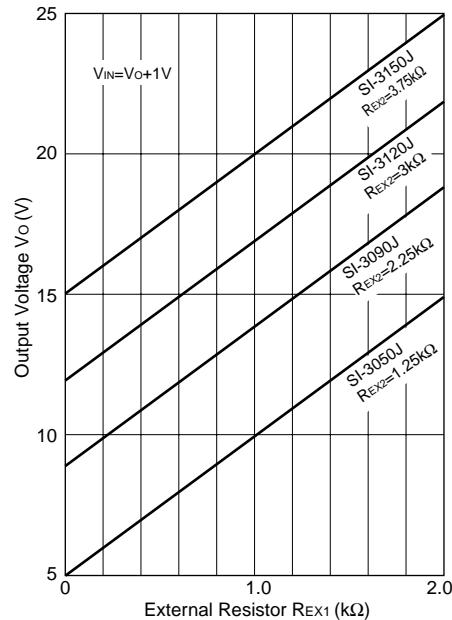

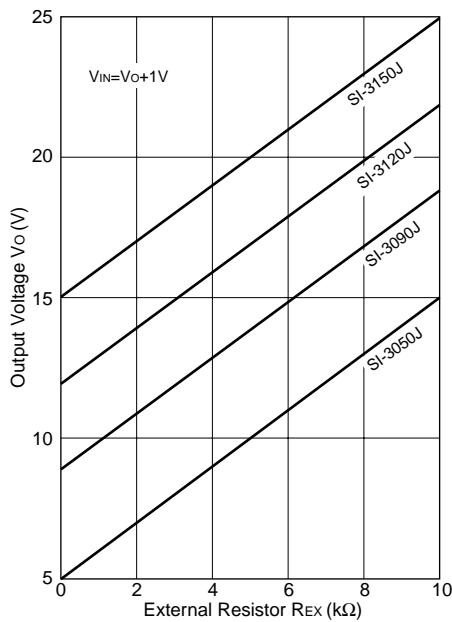

The value of the external resistors may be obtained as follows:

$$R_{EX1} = \frac{V_{O4} - V_{O4}}{S \cdot I_{4IN}}, \quad R_{EX2} = \frac{V_{O4}}{(S-1) \cdot I_{4IN}}$$

\* $V_{O4}$ : Output voltage of SI-3000J series

$S$ : Stability coefficient of  $I_{4IN}$  (may be set to any value)

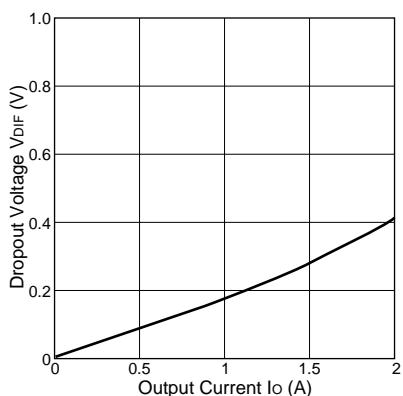

Note: In the SI-3000J series, the output voltage increase can be adjusted as mentioned above. However, when the rise is set to approximately 10V compared to output voltage  $V_{O4}$ , the necessary output current may not be obtained due to the S.O.A. protection circuit in the SI-3000J series.

### Note on Thermal Protection:

The thermal protection circuit is intended for protection against heat during instantaneous short-circuiting. Its operation is not guaranteed for short-circuiting over extended periods of time.
